Outline

- *Objectives*
- *Background*
- *Phase I & II Experiments*
- *Observations*
- *Conclusions*

Background

Example of Arena Testing

Weapons & Materials Research Directorate

Terminal Effects Division

All angles on collection panel are measured from reference point

Background (cont.)

CARTRIDGE, 105mm, DPICM, XM915/XM916

Terminal Effects Division

Keith E. Van Biert, "Development of the 105mm XM915/XM916 Projectiles, Design, Testing and Analysis", ARFSD-TR-91021, August 1991.

DPICM – Dual Purpose Improved Conventional Munition

Objectives

Weapons & Materials Research Directorate

Terminal Effects Division

- **PHASE I:**

Validate a “reference plane” and a “reference origin” establishing a standard operating procedure for XM-80 grenade arena testing

Observe XM-80 grenade shell expansion

- **PHASE II:**

Observe the grenade shell expansion, section of fragments and individual fragment for orientation

Experimental Approach

Weapons & Materials Research Directorate

Terminal Effects Division

- **PHASE I**

Use radiographic diagnostics to establish the fragmenting XM-80 grenade reference plane with respect to the horizontal plane

- **PHASE II**

Use radiographic system and unique shielding method to observe selected portion of the XM-80 fragment expansion

Conclusion

Weapons & Materials Research Directorate

Terminal Effects Division

Phase I (Establish a Reference Line and Point)

- **Reference plane** is 31.75mm (1.25”) from the bottom of grenades’ skirt
- **Point burst reference** is located at the intersection of the reference plane and the axis of symmetry

Phase II (Observe Grenade Expansion)

- Grenade’s shell expansion is similar when supported by foam or steel
- Fragmentation is separated into 2 major groups
 - Group 1 is directed at 85° to 90°
 - Group 2 is directed at 80° to 85° due to the tapering of explosive / Taylor angle
- Minimum number of fragments are directed at 90° to 95°, due to corner effects
