

# 120 mm Tank Ammunition Advanced Case System (ACS)

Presented At  
The National Defense Industrial Association's Joint  
Armaments Conference, Exhibition, & Firing  
Demonstration

19 May 2010

Jeff Berg  
Principal Engineer  
120mm Training Ammunition  
ATK

M1002

M865

Approved for public release 22 CFR 125.4(b)(13) applicable. PAO Log# 503-10

## **120 mm Tank Ammunition Advanced Case System (ACS)**

- **Background**
- **Program Summary**
- **ACS Design Options**
- **Double Wall Joint vs. Skive Joint**
- **Technical Challenges – Bond Joints**
- **Analysis and Solutions**
- **Conclusion**

# M1002 Cartridge (current case design)

A premier aerospace and defense company

## Advanced Case System (ACS)

- Program:
  - **Product Manager Large Caliber Ammunition: Program Management and Guidance**
  - **Joint Munitions Command (JMC): Executes and Manages the 120mm Multi-Year contracts**
  
- Members: **PM-MAS, PM-LC, JMC, ARDEC, ATK, GD-OTS, Esterline Defense Group, American Ordnance**
  
- Objective: **Provide a re-designed cartridge solution to eliminate a contributing cause of damaged rounds during training.**
  - **Relocate the cartridge bond joint**
  - **Qualify the modified cartridge design**
  - **Transition into production with qualified design**

## ACS Design

- **Joint: Double Wall, Skive, Single Wall**
- **Adhesive: Green two-part epoxy or Red NC based adhesive**
- **Propellant Bag: Tailored or Tied**

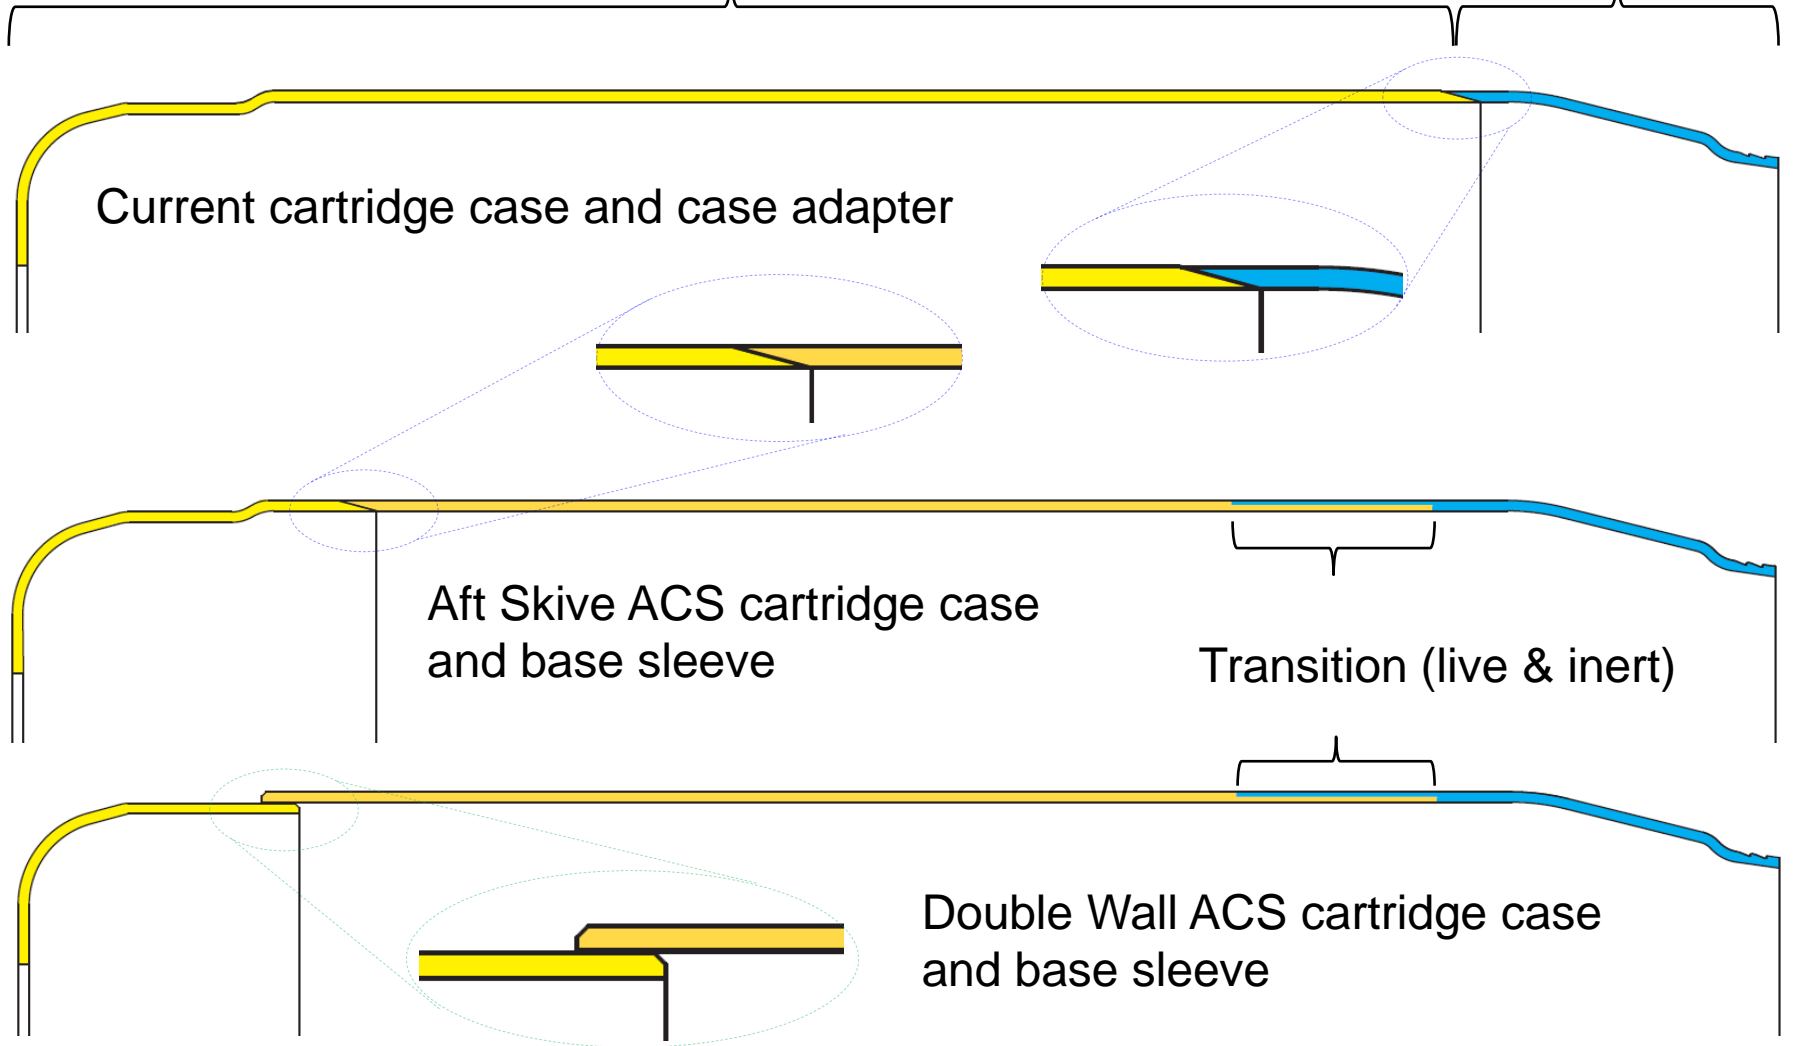

# ACS Design Options – Cartridge Joint

Live NC composition

Inert composition

# Double Wall vs. Aft Skive Joint

A premier aerospace and defense company

	Double Wall Joint	Aft Skive Joint
Pros	<ul style="list-style-type: none"><li>•Manufacturing process simpler.</li><li>•Joint is more robust</li><li>•Joint has better protection</li></ul>	<ul style="list-style-type: none"><li>•Producibility – similar to current design.</li></ul>
Cons	<ul style="list-style-type: none"><li>•Ballistic concerns:<ul style="list-style-type: none"><li>•Increased risk for residue.</li><li>•Restricts seal performance (joint too strong).</li></ul></li><li>•Diametric repeatability risk (adhesive).</li><li>•Trimmed end of case difficult to paint.</li></ul>	<ul style="list-style-type: none"><li>•Component manufacturing more complex (same as current design).</li><li>•Cartridge bonding process more difficult.</li><li>•Joint is more exposed.</li></ul>

## Aft Skive Joint:

- Cartridge alignment (straightness): joint location allows for misalignment.
  - Early concern that has since been resolved.
- Aft skive joint is more exposed than double wall.
  - Preliminary qualification results demonstrate aft skive location is superior compared to the current design.
  - Actual protection is quite good due to proximity to case base.

## Double Wall Joint:

- Case base seal performance
  - Occasional gas leakage aft of case base seal.
  - Modeling was able to repeat the condition.
  - Design modifications investigated and modeled to correct.
  - Testing successfully validated the model results.
- Design Modifications lead to increase risk of energetic exposure
  - Continue to evaluate solutions.
  - Objective – no more risk than current design

## Comparative Analysis of ACS Double Wall and Current Case System

### MODEL ASSUMPTIONS:

- Explicit dynamic analysis performed in ABAQUS.
- Axi-symmetric analysis performed.
- Up to 200 psi uniform pressure applied on the inside of the case.

Increment 3001: Step Time = 1.5003E-04  
Z X Deformed Var: U Deformation Scale Factor: +1.0000e+00  
Status Var: STATUS

- **Model of improved double wall with 6.25 mm axial gap showed good sealing.**
  - **Seal performance was comparable to the current case system.**
  - **Of all ACS double wall designs models, the 6.25 mm gap had the best results.**
- **Ballistic testing completed to validate results.**
- **ACS qualification program proceeding with both the ACS double wall and skive joints.**
- **Down-select to a single joint anticipated upon completion of qualification tests.**
