Work Measurement Activities

Determine what is to be measured and how often Determine measurement methods

- Self recorded (time sheets, etc.)
- Time and motion studies
- Work sampling

Measure, analyze, and report

If it moves, measure it. If it doesn't move, measure it and make it a constant.

Software Engineering Institute Carnegie Mellon

A Brief History of Work sampling

L.Tippet developed work sampling in England in 1927 R. L. Morrow introduced the technique in US in the 1941 C. L. Brisley used the term work sampling 1952

Estimates percent of the time spent on identified activities Random observations to record the activities that a worker performs

Software Engineering Institute Carnegie Mellon

Absolute vs. Relative Precision

Acceptable relative and absolute errors set to 5% 1000 units to allocate

Allocated Based on Sample Percentages	Absolute	Relative
600	± 50	± 30
300	± 50	±15
100	± 50	± 5

Relative is more precise but the number of sample can increase dramatically. For example for a 5% error for a 10% activity

- Absolute error, sample size = 138
- Relative error, sample size = 1380

Calculating Sample Size – Absolute Precision

Sample Size

$$n=rac{\left(z^2*p*(1-p)
ight)}{e^2}$$

Where:

- Z = Z value (e.g. 1.96 for 95% confidence level)
- p = percentage expressed as decimal
- e = Acceptable error percentage as a decimal (e.g., .04 = ± 4%)

Confidence	Z
99.9%	3.250
99%	2.326
95%	1.960
90%	1.645

Example

Want 95% confidence the activity is within \pm 5% and we estimate the activity use 20% of the time

$$n = (1.96^2 * 0.2 * (1 - 0.2)) / 0.05^2$$

Software Engineering Institute Carnegie Mellon

Calculate error limits for a sample size – Absolute Precision

Since we know the sample size is calculated with

$$n=rac{\left(z^{2}st pst\left(1-p
ight)
ight)}{e^{2}}$$

We can determine the limit of error, e with

$$e=z*\sqrt{rac{p*(1-p)}{n}}$$

Example

What is our Limit of Error for 95% confidence when we estimate the activity use 20% of the time and we have 125 samples

$$e = 1.96 * \sqrt{0.2 * (1 - 0.2)} / 125 = 0.09 = \pm 9\%$$

Software Engineering Institute

Calculating Sample Size – Relative Precision

Sample Size

$$n=rac{z^2*(1-p)}{p*e^2}$$

Where:

- Z = Z value (e.g. 1.96 for 95% confidence level)
- p = percentage expressed as decimal
- e = Acceptable error percentage as a decimal (e.g., .04 = ± 4%)

Confidence	Z
99.9%	3.250
99%	2.326
95%	1.960
90%	1.645

Example

Want 95% confidence the activity is within \pm 5% and we estimate the activity use 20% of the time

$$n = (1.96^2 * (1 - 0.2)) / (0.2 * 0.05^2)$$

n = 6,146

Software Engineering Institute Carnegie Mellon

Calculate error limits for a sample size – Relative Precision

Since we know the sample size is calculated with

$$n=rac{z^2*(1-p)}{p*e^2}$$

We can determine the limit of error, e with

$$e=z*\sqrt{rac{(1-p)}{p*n}}$$

Example

What is our Limit of Error for 95% confidence when we estimate the activity use 20% of the time and we have 125 samples

$$e = 1.96 * \sqrt{(1 - 0.2)} / 0.2 * 125 = 0.35 = \pm 35\%$$

Work Sampling Procedure

Determine the activities to be sampled Take a preliminary sample to obtain an estimate Compute the sample size required Prepare a schedule for the random observations Observe and record the activities Determine how workers spend their time (usually as a percent)

Example – Activities to be Sampled

Work activities we want to measure

- Work effort
- Rework effort
- Other

We want 95% confidence

We don't want the error to be greater than $\pm 5\%$

Software Engineering Institute Carnegie Mellon

Preliminary Sample

Short study to establish the proportion for each of the activities If you already have an understanding from other studies, you may skip this step.

Example

We take 100 samples and the results are:

Work Activity	Observations	Proportion
Work Effort	64	0.64
Rework Effort	12	0.12
Other	24	0.24
Total	100	1.00

Software Engineering Institute Carnegie Mellon

Example – Compute Sample Size¹

- n = number of samples n = $(Z^2 * p * (1-p)) / e^2$ n = $(1.960^2 * 0.12 * (1 - 0.12)) / 0.05^2$ n = (3.84 * 0.12 * 0.88) / 0.0025n = 0.404504 / 0.0025n = 162 (sample size for Rework Effort)
- n = 354 (sample size for Work Effort)
- n = 280 (sample size for Other)

Software Engineering Institute

Carnegie Mellon

Example – Compute Sample Size²

What should the sample size be?

- 162
- 354
- 280

Carnegie Mellon

Prepare Schedule for Random Observations

Inputs

- Number of people to be sampled
- Number of samples to be taken
- Reporting period

Many different ways to create the schedule

- Use Excel
- Write a program
- Buy a device
- Buy some software

Schedule should tell you

- What days
- What times
- What people

Software Engineering Institute Carnegie Mellon

Observe and Record the Activities – Take Samples

Need to reassure people sampling will be benign

- Sheet with names down the left and activities down the right
- Check each name as they are sampled
- · Check the activity being observed for each name

Name	Sampled?
G. Ford	\checkmark \checkmark \checkmark \checkmark
H. Liu	$\int \int \int \int$
A. Park	$\int \int \int \int$
L. James	$\int \int \int \int$
P. Carne	\checkmark \checkmark \checkmark \checkmark
S. Gomez	$\int \int \int \int$
V. Gogh	$\int \int \int \int$

Activity	Samples
Work	J J J J J J J J J J J J J J J J J J
Rework	$\int \int \int \int$

Map Activities to your Processes and Models

Ties performance to your processes and to model parts

- Helps understand where performance was affected by process change
- Performance modeling
 - Understand performance affects of proposed changes
 - If adopting a process, can use as initial estimate of performance
- Build a performance database for comparison
