4

How Do People Usually Decompose Systems?

What's

What's Wrong with This?

- By beginning with separating out command and control, or information assurance at the top level, it becomes harder to build in these essential capabilities into the other components of the system
- The interfaces become complex, speed of execution is reduced, and "holes" in the system become common

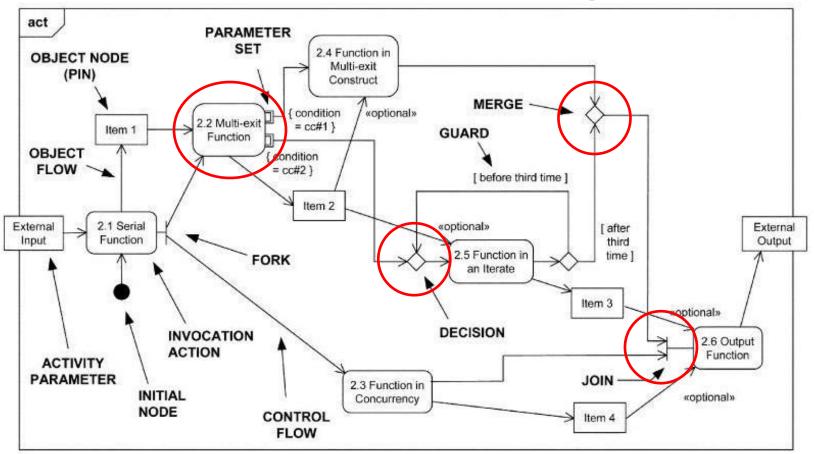

How Can We Do It Better?

- Do not decompose C2 and IA/Security at the top level
- Let those aspects of control come out of the functional analysis
- Then identify and allocate those functions to the C2 participants and organizations
- But the current languages do not help the situation, because they do not capture all the decision points explicitly as functions

Example: SYSML

Decision Points

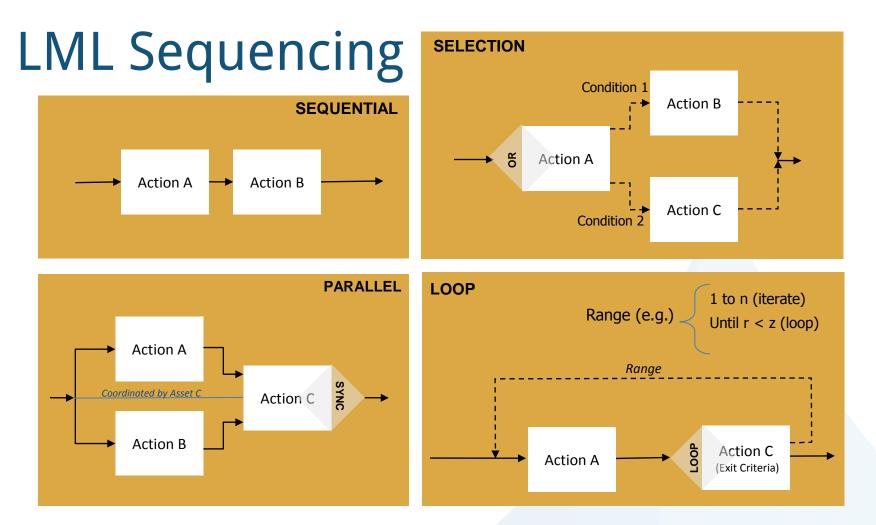

How are decisions captured by these diagrams?

LIFECYCLE MODELING LANGUAGE SEQUENCING

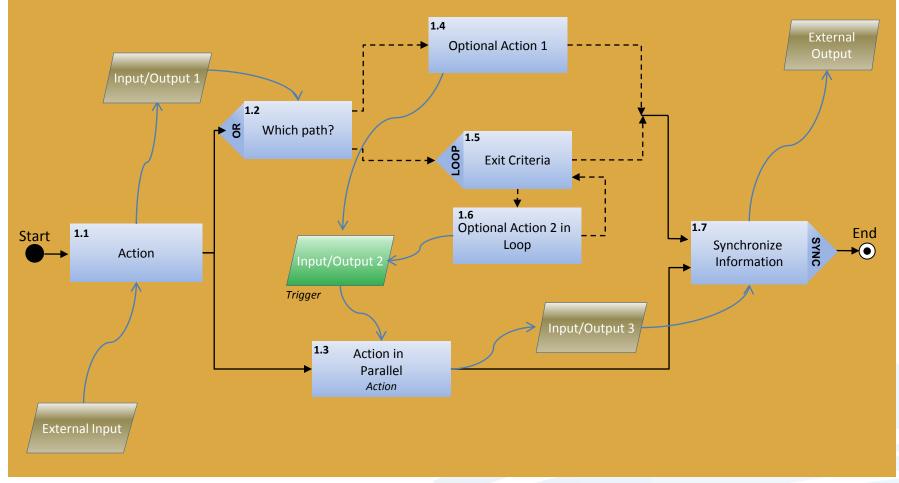

No constructs – only special types of Actions – ones that enable the modeling of command and control/ information assurance to capture the critical decisions in your model

LML Action Diagram Captures Behavior

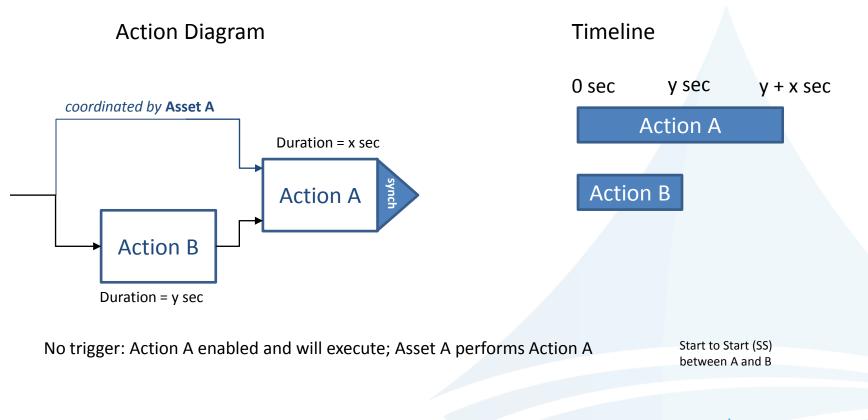

Example: Sync Execution Logic

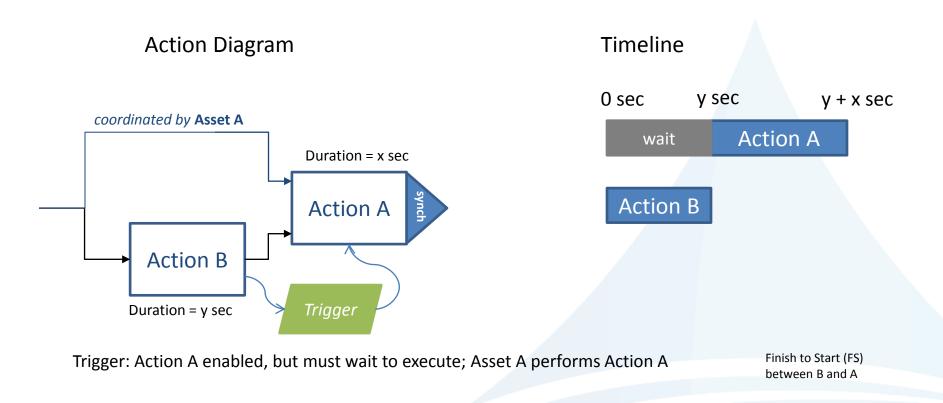

Execution Logic – Concurrency No Trigger; No Coordination Action

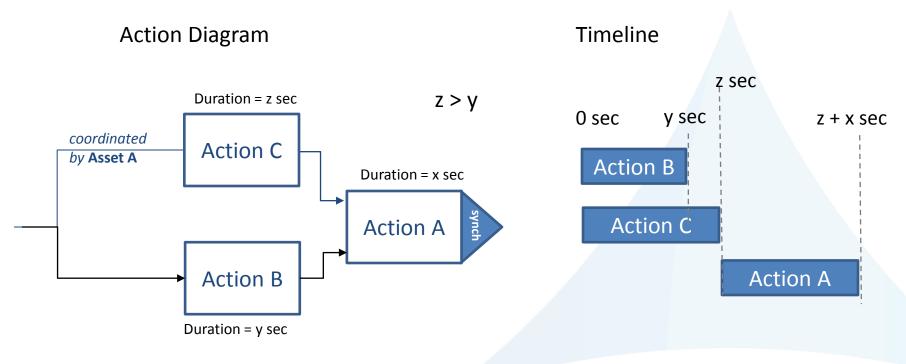

Execution Logic – Concurrency With Trigger; No Coordination Action

Execution Logic – Concurrency No Trigger; With Coordination Action

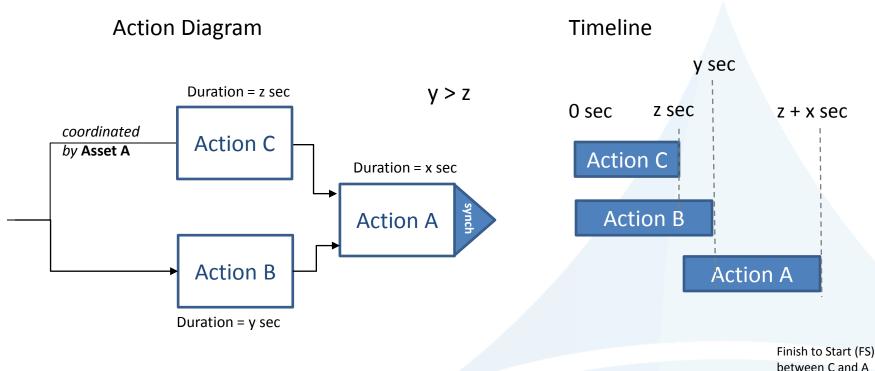

No trigger: Action C enabled and will execute; Asset A performs Action A and Action C

Finish to Start (FS) between C and A

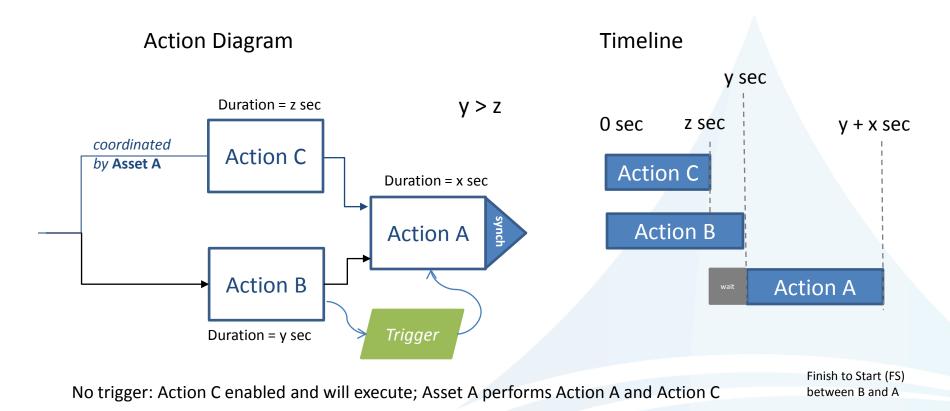

Execution Logic – Concurrency No Trigger; With Coordination Action

No trigger: Action C enabled and will execute; Asset A performs Action A and Action C

Execution Logic – Concurrency With Trigger; With Coordination Action

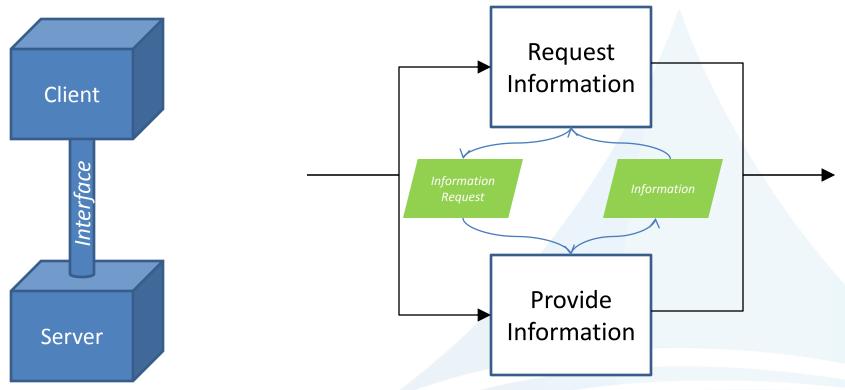

Problem with not including synch

Physical View

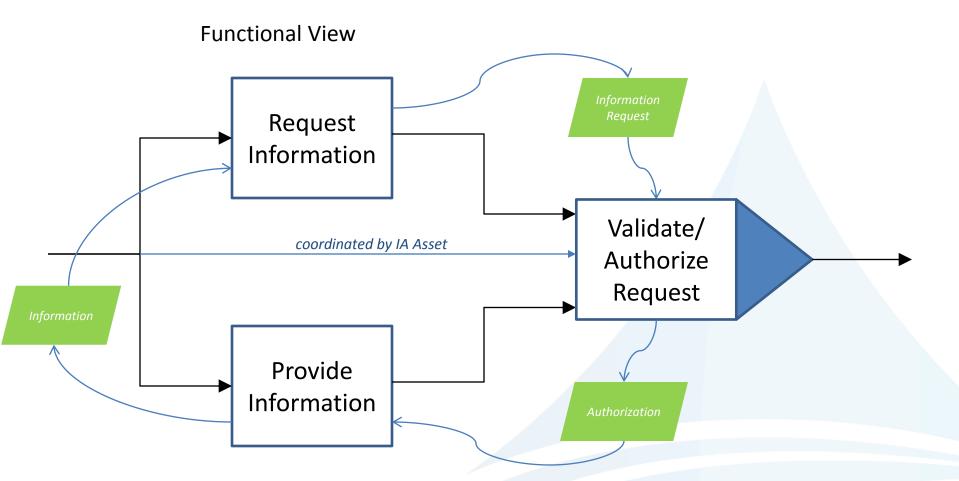

Functional View

Deadlock occurs; no IA or C2 functionality

Problem with not including synch

Deadlock Relieved; IA functionality identified

TOOL NEEDS

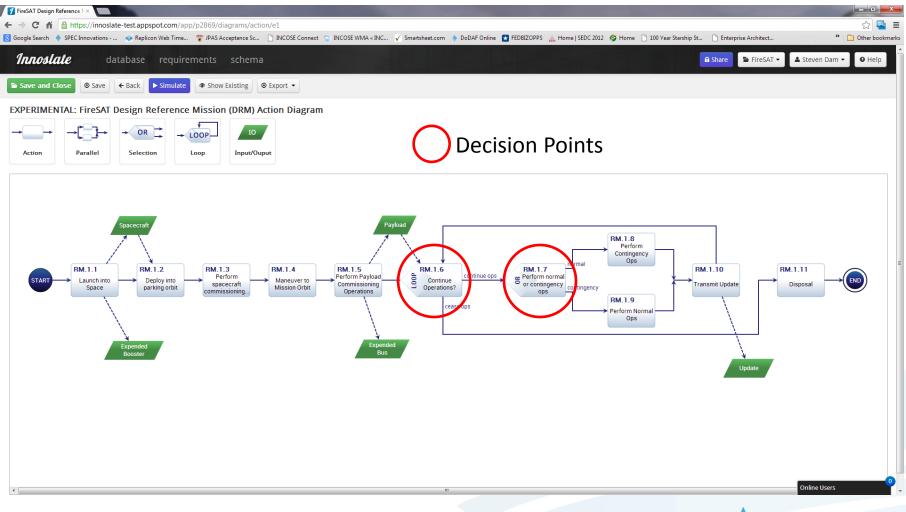

Innoslate®

- Innoslate 1.0 meets most of the LML Action diagram requirements

 Synch is currently missing, but expected soon
- Since LML is designed as an open standard, we hope other tool vendors consider adding the Action diagram to their tools as well

FireSAT Design Reference Mission

Simulation

- Integrated simulator (both continuous and discrete event) are needed for ensuring executability of design and operational procedures
- Innoslate has a first cut discrete event simulator built-in, but more work is needed
- Linking to other simulation tools (e.f. Satellite Toolkit) may be feasible in the future

Cost and Resources can also be captured in this simulation; each decision point can also be prompted for a user response

SUMMARY

Summary

- The problem with modeling C2, IA, Security and other decision points
- LML helps force the capturing of decision points

Way Ahead

 Further work on modeling decision points of all kinds is needed to ensure that that information is captured as part of the design and analysis
