

# Air Force Research Laboratory

***Integrity ★ Service ★ Excellence***

## **Systems Engineering & Basic Research**

**28 October 2015  
Wednesday, 10:50 am – 11:25 am  
Presentation 17856**

**Dr. Kathleen M. Kaplan  
Program Manager  
Air Force Office of Scientific Research**

# Overview

- **In a nutshell, the presentation will discuss the intersection of basic research and systems engineering**
- **Examples of current basic research will be discussed in juxtaposition of systems engineering principles**

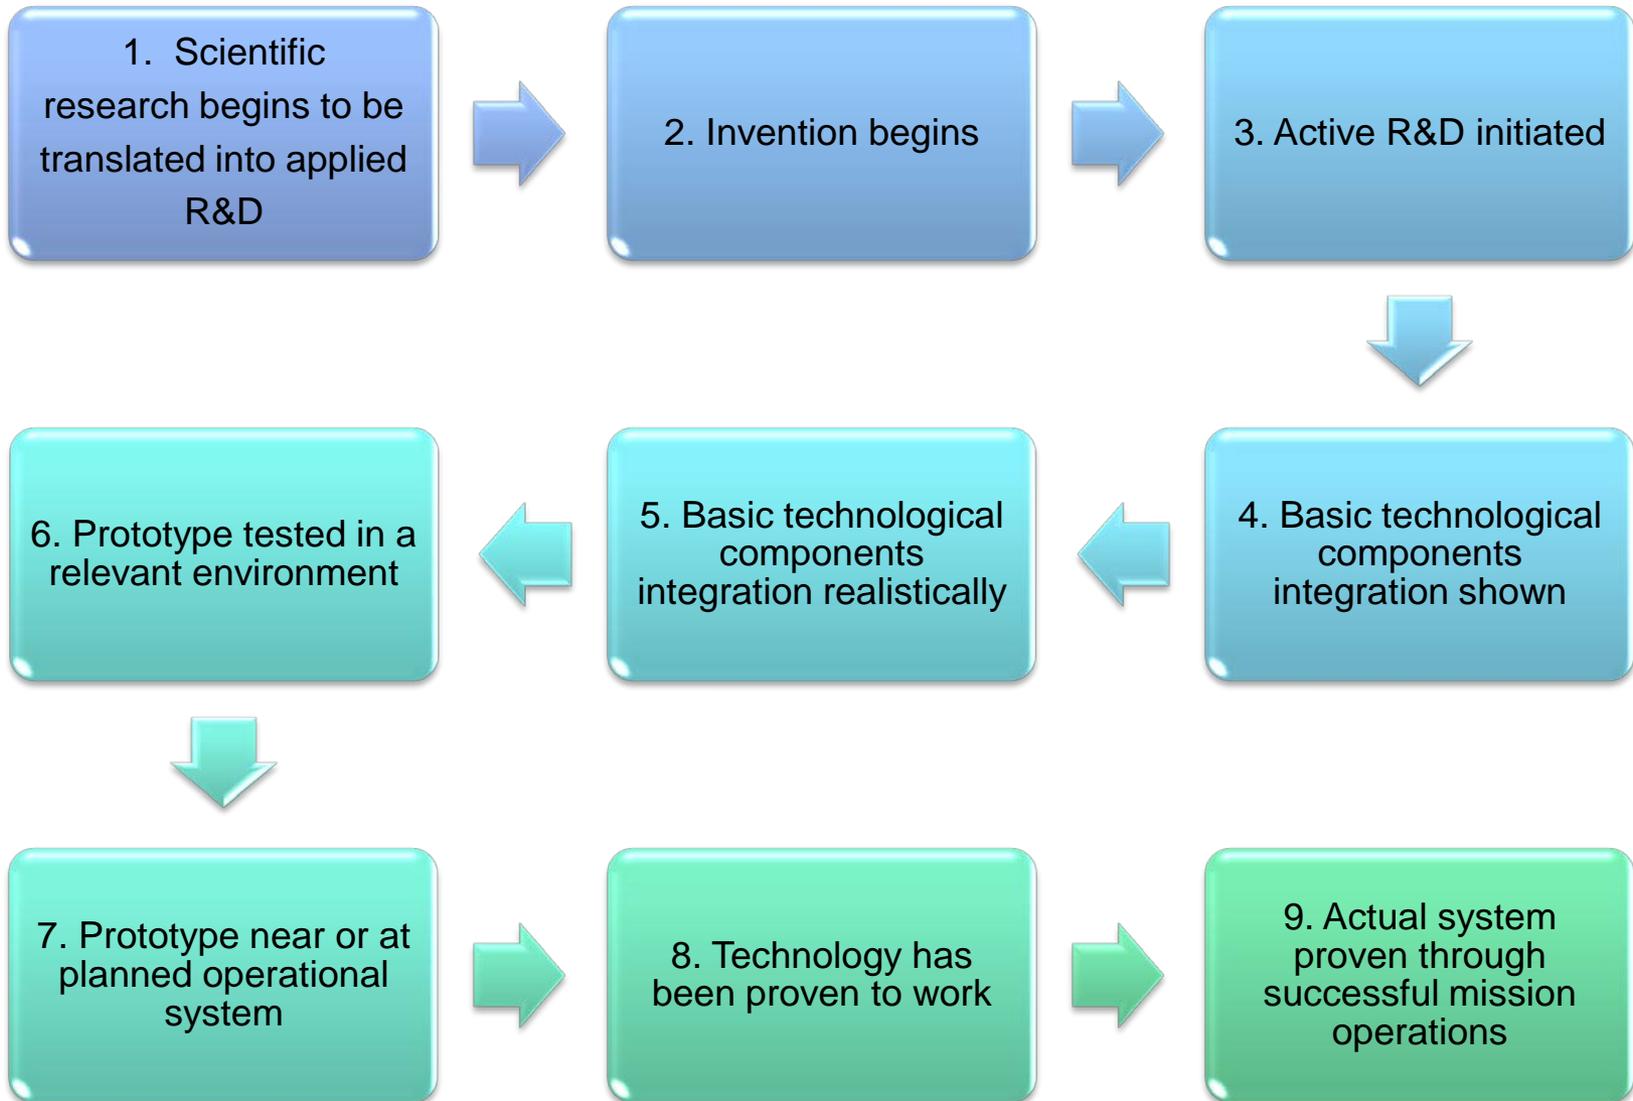

# Systems Eng v. Basic Research

- **Systems engineering:**
  - **Very structured process in order to achieve highly defined objectives and requirements**
- **Basic research:**
  - **The fundamental step in the Research, Development, Test, and Evaluation (RDT&E) life cycle**
  - **Does not employ such a structured process, and instead favors creative discovery**

# Technology Readiness Levels (TRLs)

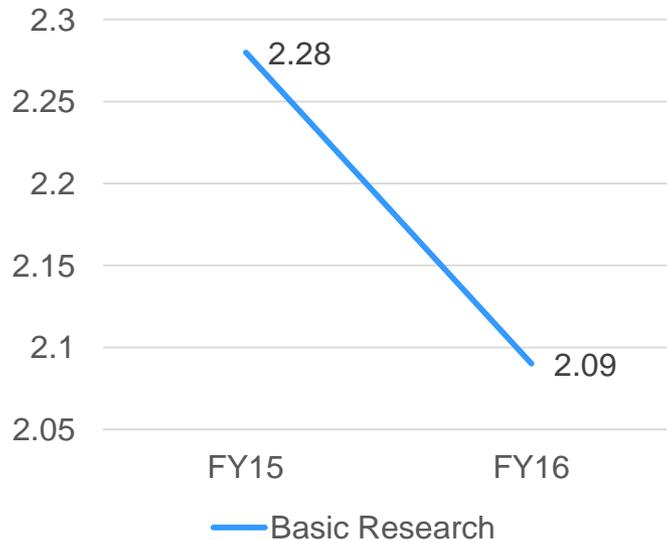

# President's Budget

Basic Research

FY16 President's budget:

- decrease basic research (6.1) funding (FY15 \$2.28B to FY16 \$2.09B)
- decrease ~ 8.3%

**Basic research S&Es must utilize every resource in order to “do more, without more”**

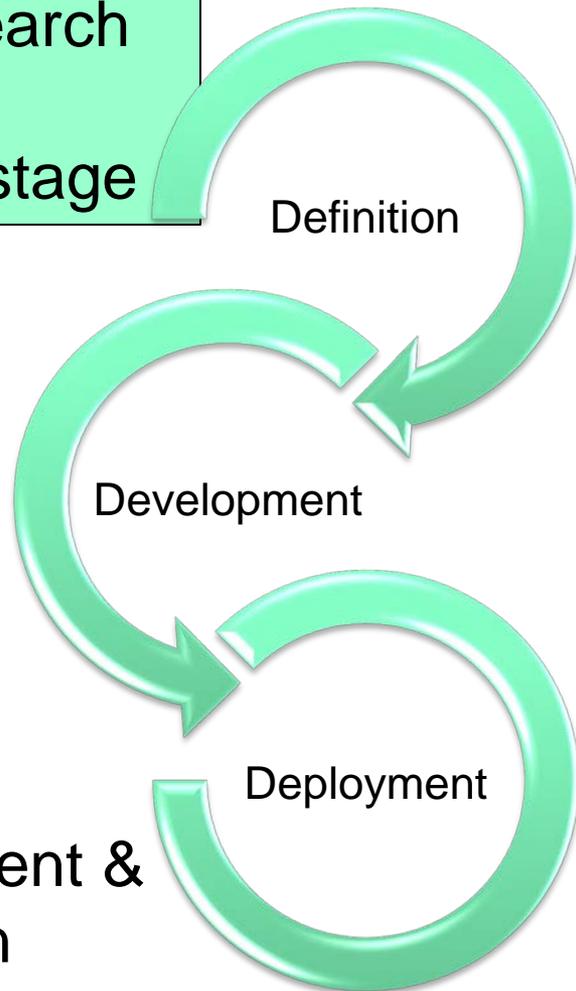

This is the battle cry of Systems Engineering, and in utilizing Systems Engineering principles, basic research S&Es will be able to maintain the balance required to improve performance while maintaining affordability

# Systems Engineering & Basic Research

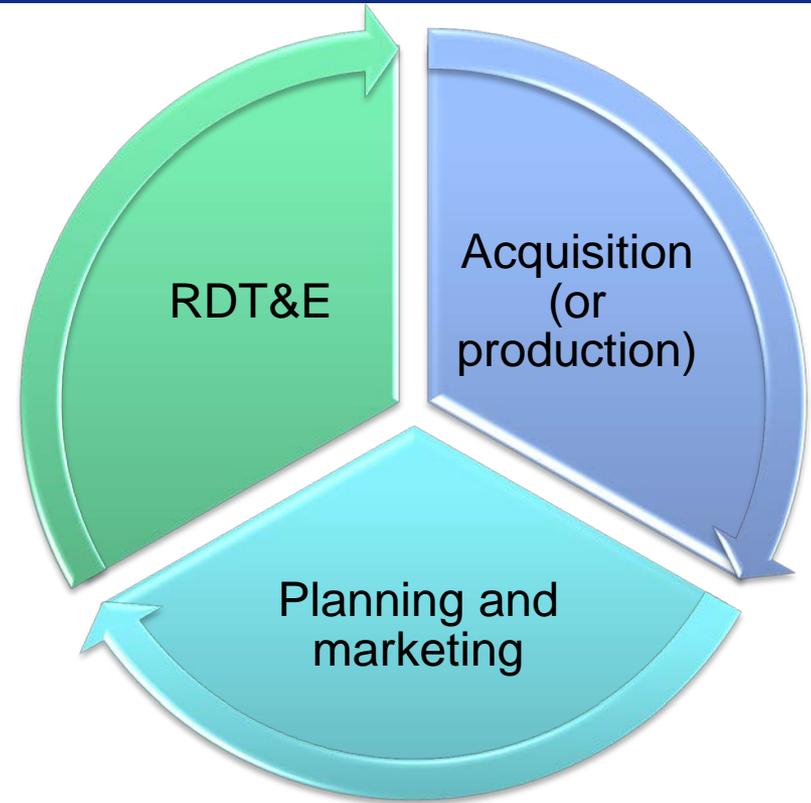

Basic research is in the definition stage

Applied Research & T&E

Full Scale Development & Production Support

Systems Engineering Life Cycles

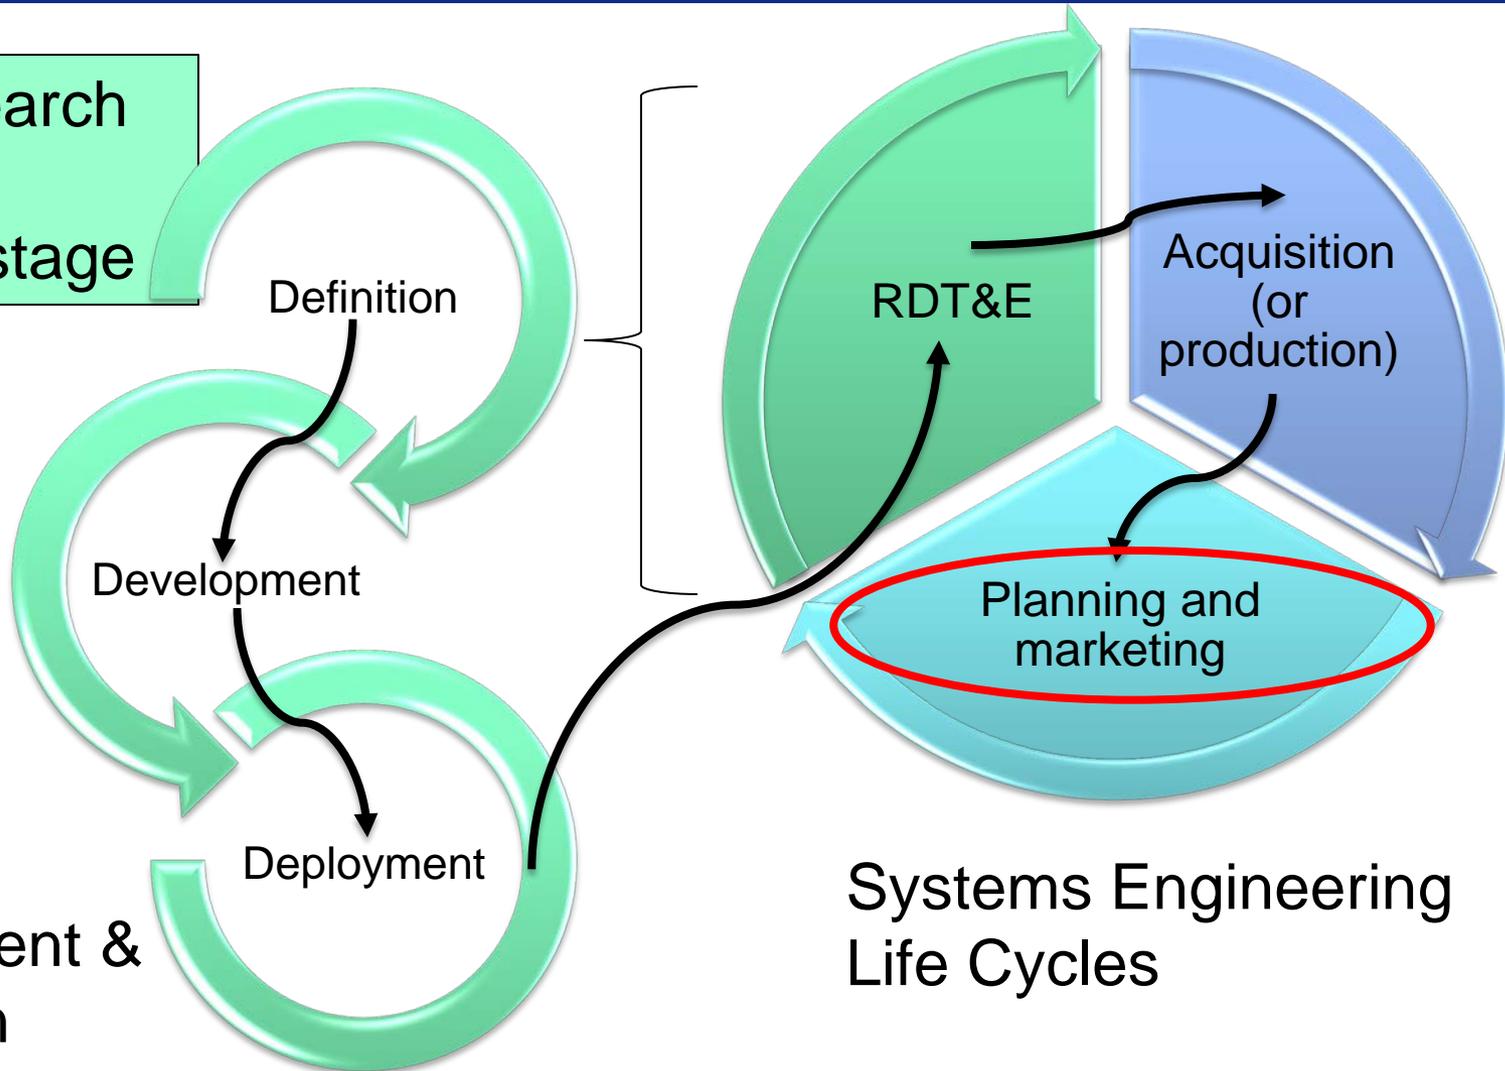

# Systems Engineering & Basic Research **GOAL**

Basic research is in the definition stage

Applied Research & T&E

Full Scale Development & Production Support

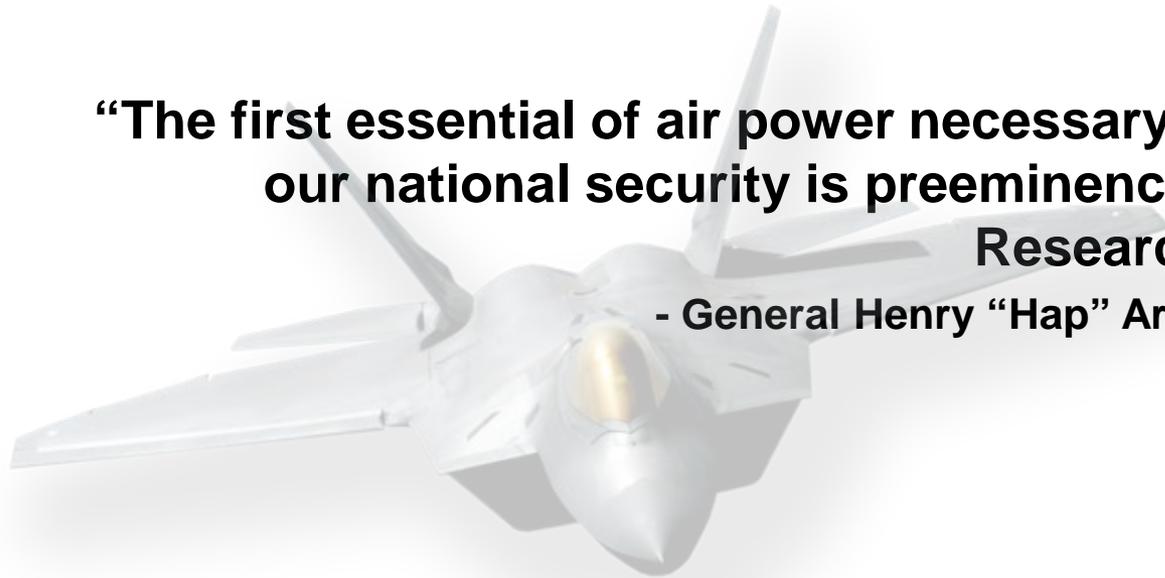

# United States Air Force Mission

**The Mission of the United States Air Force is to  
Fly, Fight, and Win...In *Air, Space, and Cyberspace***

**“The first essential of air power necessary for  
our national security is preeminence in  
Research.”**

**- General Henry “Hap” Arnold**

**“...innovation – fueled by intelligent, creative Airmen – will remain a key  
part of who we are and what we value as a service.” Gen Welsh, CSAF**

# Air Force Leadership

President Barack H. Obama,  
Commander-in-Chief

Secretary of Defense  
Ashton B. Carter

Secretary of the Air Force  
Deborah Lee James

General Ellen M. Pawlikowski  
AFMC Commander

Major General Thomas J. Masiello  
AFMC Commander

# AFMC - Who We Are

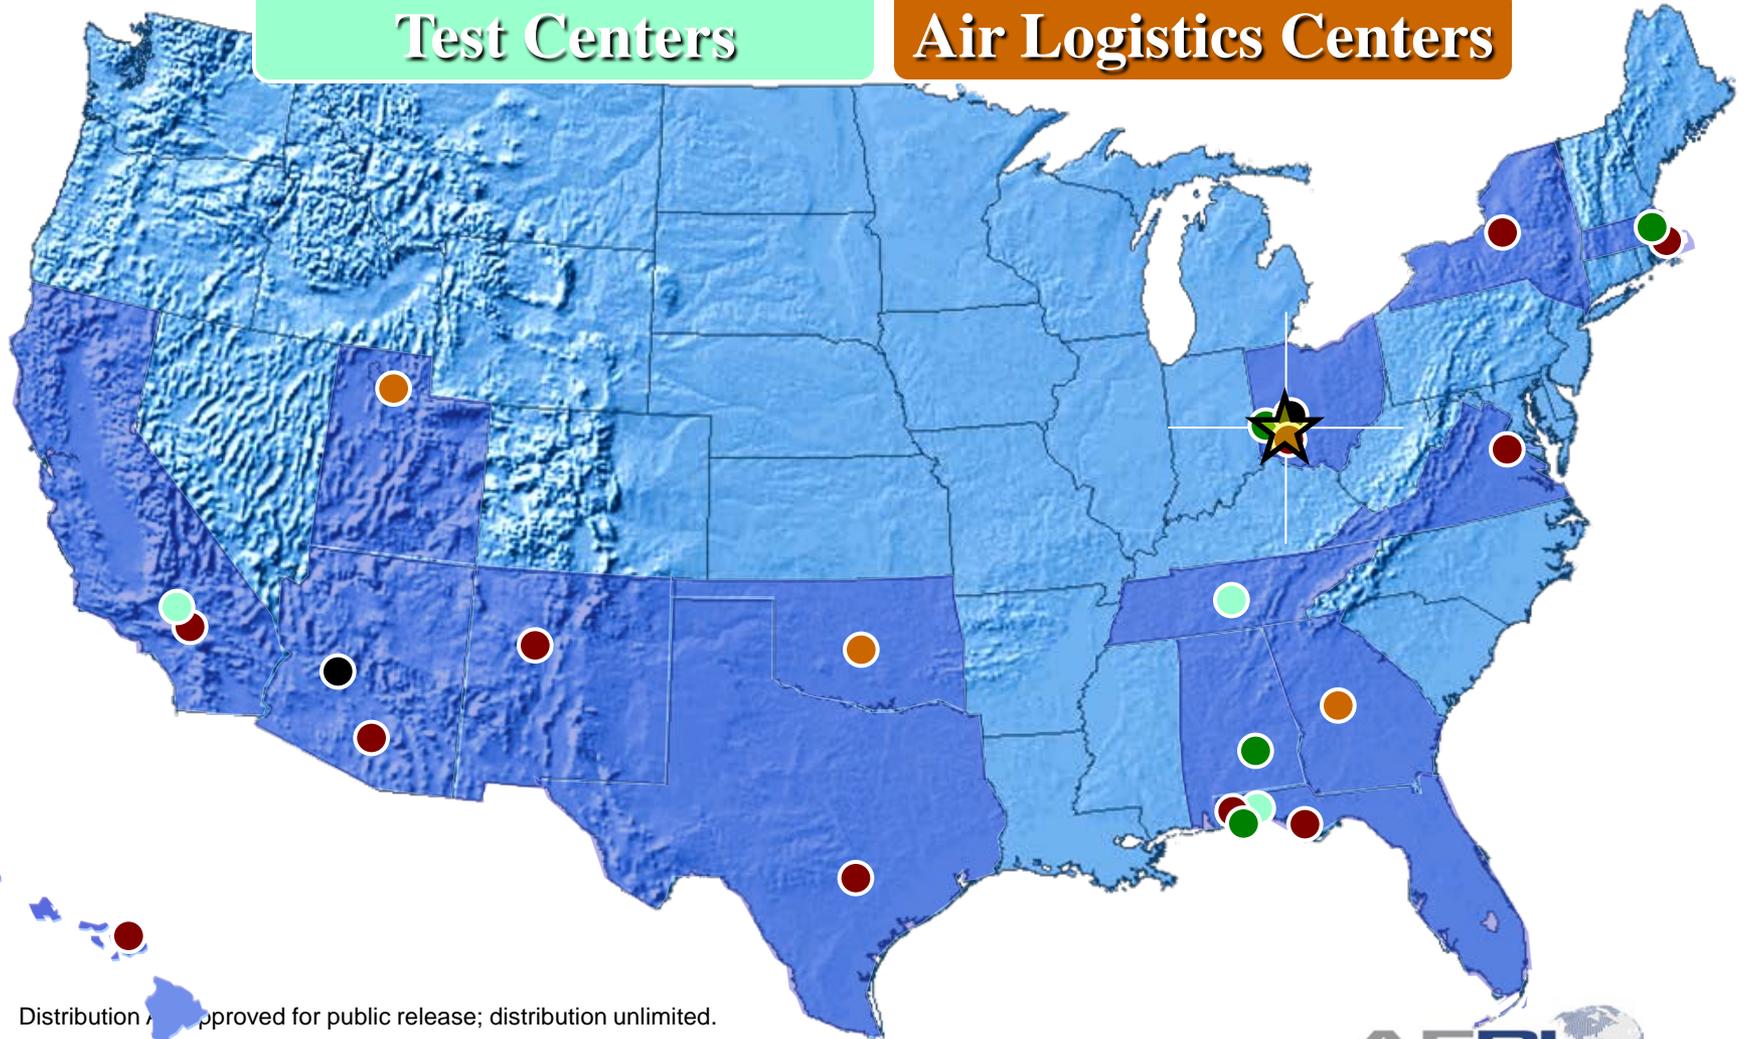

AF Research Lab

Product Centers

Specialized Units

Test Centers

Air Logistics Centers

Distribution approved for public release; distribution unlimited.

# Air Force Research Laboratory (AFRL) Mission

Nuclear

Technology

Life Cycle  
Management

Test & Evaluation

Sustainment

**LEADING the discovery, development, and integration of affordable warfighting technologies for our air, space, and cyberspace force.**

# Air Force Research Laboratory (AFRL) at a Glance

<b>AFRL Headquarters</b> 	<b>711<sup>th</sup> Human Performance Wing</b> 	<b>Materials &amp; Manufacturing</b> 	<b>Aerospace Systems</b> 	<b>Sensors</b> 
------------------------------	--	--	------------------------------	--------------------

**Information**  
Rome Research Site, NY

**International Sites**

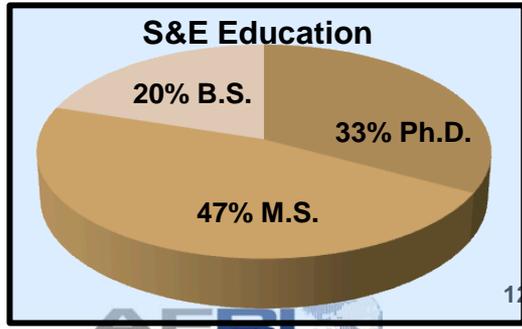

**Space Vehicles Directed Energy**

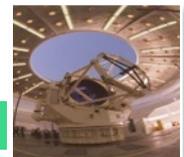

**Munitions**  
Eglin Air Force Base, FL

**AF Office of Scientific Research**

	Employees	Civilian	Military
<b>Total</b>	5,827	79%	21%
<b>S&amp;Es</b>	3,455	80%	20%

Maui Research Site, HI

# AFRL Technical Directorates and Core Competencies

## AF Office of Scientific Research

- Aerospace, Chemical & Material Sciences
- Education & Outreach
- Mathematics, Information, & Life Sciences
- Physics & Electronics

## Aerospace Systems

- Air Vehicles
- Control, Power & Thermal Management
- High Speed Systems
- Space & Missile Propulsion
- Turbine Engines

## Directed Energy

- Directed Energy & EO for Space Superiority
- High Power Electromagnetics
- Laser Systems
- Weapons Modeling and Simulation

## Information

- Autonomy, C2, & Decision Support
- Connectivity & Dissemination
- Cyber Science & Technology
- Processing & Exploitation

## Human Performance

- Bio-effects
- Decision Making
- Human Centered ISR
- Training

## Munitions

- Fuze Technology
- Munitions AGN&C
- Munitions System Effects Science
- Ordnance Sciences
- Terminal Seeker Sciences

## Sensors

- Advanced Devices & Components
- Layered Sensing Exploitation
- Multi-Int Sensing (RF/EO)
- Spectrum Warfare

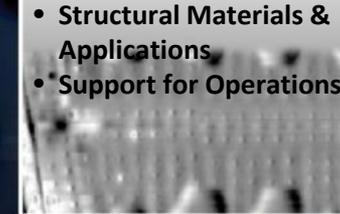

## Space Vehicles

- Space Electronics
- Space Environmental Impacts & Mitigation
- Space OE/IR
- Space Experiments
- Platforms & Operations Technologies

## Materials and Manufacturing

- Functional Materials & Applications
- Manufacturing & Industrial Technology
- Structural Materials & Applications
- Support for Operations

# Turning Science Into Capability

## Driven by Service Core Functions

Vectored by Air Force Strategy + S&T Vision/Horizons + Product Center Needs + MAJCOM Needs

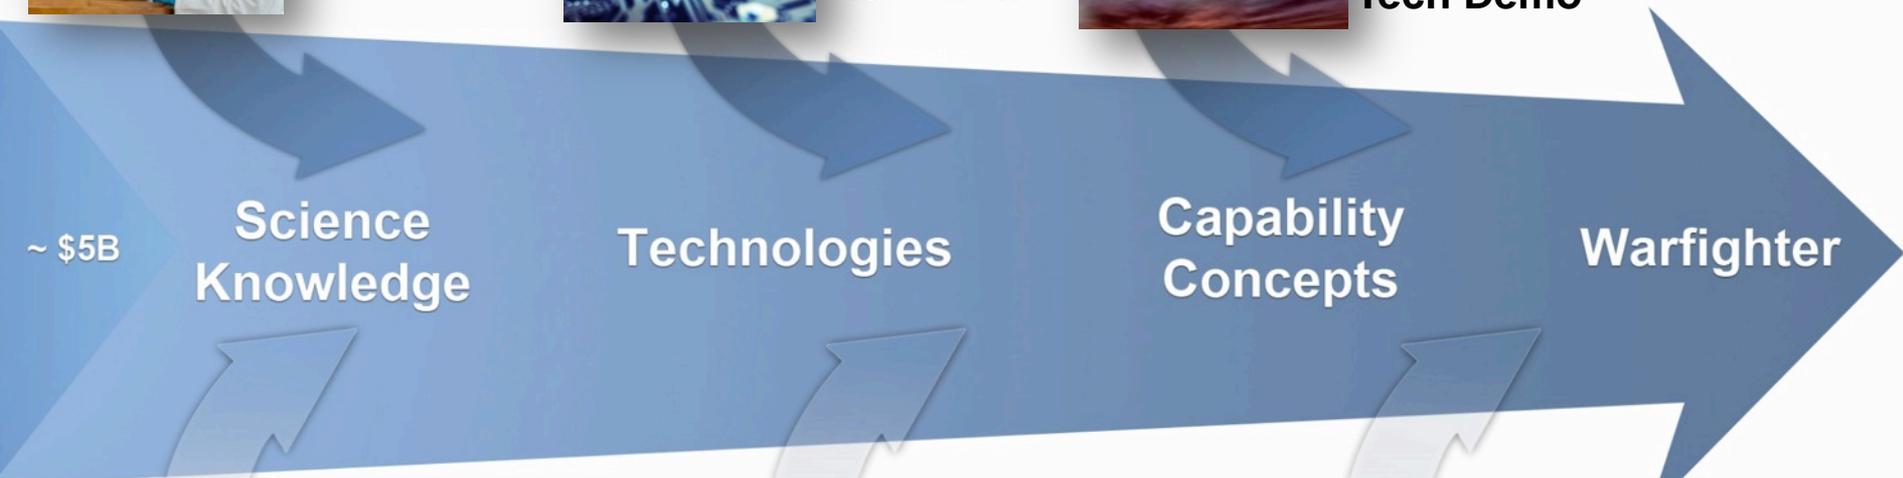

**6.1  
Basic  
Research**

**6.2  
Applied  
Research**

**6.3

Science Knowledge

Technologies

Capability Concepts

Warfighter

**Outputs:  
New Technologies**

**Outputs:  
Mature Technologies**

**Outputs:  
Flagship Capability Concepts**

25 Years

10 Years

5 Years

1 Year

Initial Operating Capability Timeline

# Systems & Software

1. Legacy System Research – Keep the current systems up-to-date
2. New Technology Research – AF must continue to be on the cutting-edge of technology; studying operating systems, compilers, virtual memory, multi/many-core platforms, etc. will drastically improve current AF systems and help to develop new S&T for the benefit of the nation

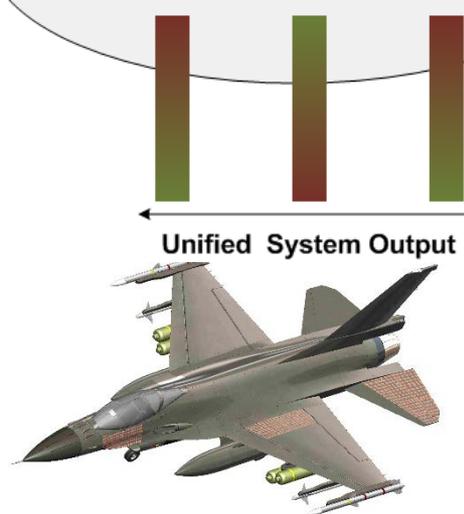

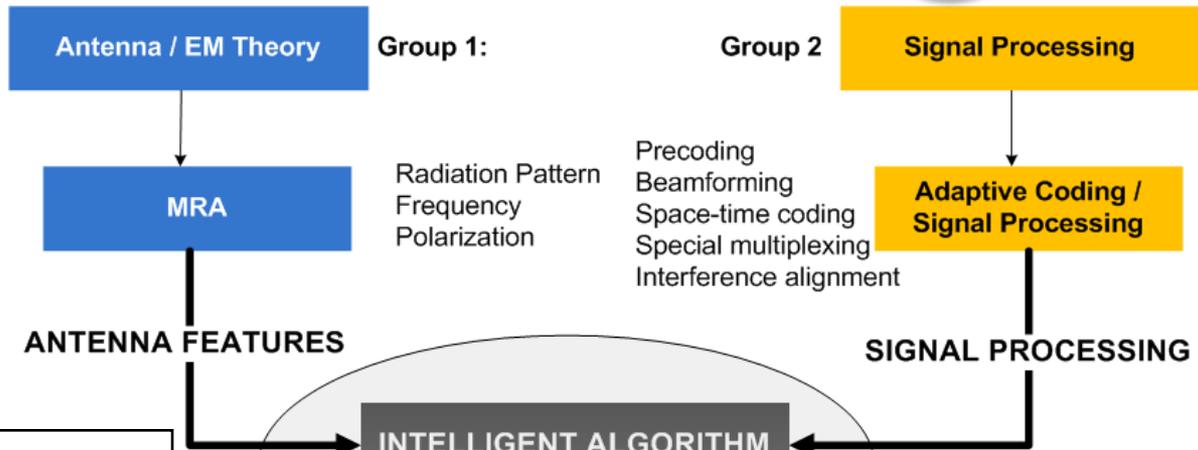

# Efficient and Intelligent Algorithms for a New Class of Multifunctional Reconfigurable Antenna Systems

Dr. Bedri Cetiner, Utah State

Problem: Antenna Tech is old!  
Approach: Development of efficient and intelligent control algorithms enabling the joint optimization of antenna and communication parameters

UNIFIED FRAMEWORK

Unified System Output

*Smart skin technology*  
New class of conformal antenna arrays of reduced size & signature along with improved direction finding capabilities & radiation pattern control

# Integrated Isogeometric Approach to Engineering Design & Optimization of Aircraft Structures

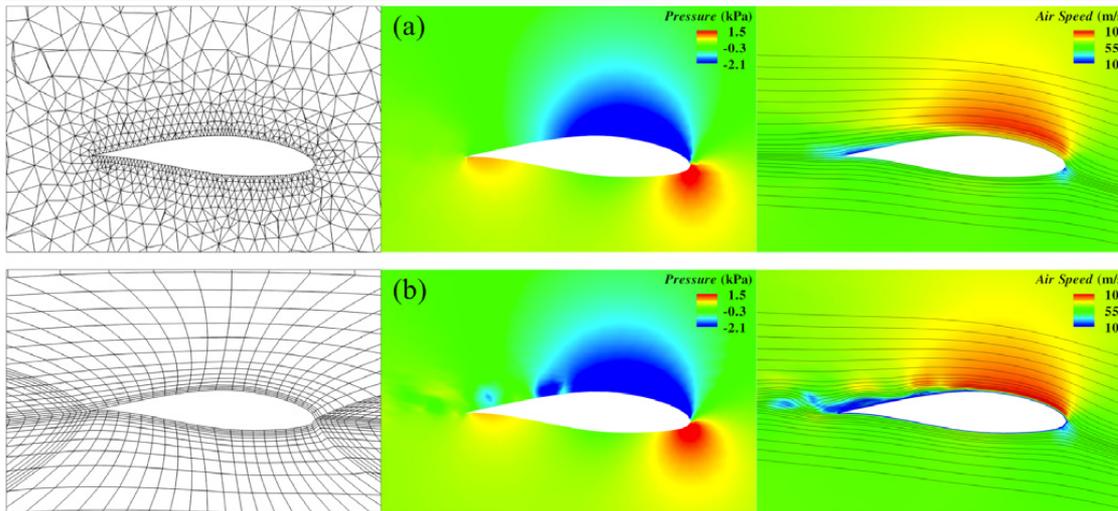

Dr. Michael Scott, BYU

Collaborative project - BYU & CU Boulder

**Problem:** Major engineering bottleneck ( $> 80\%$  of overall analysis time) wrt fixing CAD geometry and creating FEA models; FEA & CAD have incompatible geometric representations

**Approach:** Merge T-splines & Isogeometric analysis (IGA) to provide foundation for integrated design-through-analysis frameworks; this will enable: precise and efficient geometric modeling, simplified mesh refinement, smooth basis functions with compact support, superior approximation properties, integration of design and analysis

**Status:** Implemented a fully integrated isogeometric structural analysis capability; developing detailed structural aircraft wing, novel modeling approaches to enable rapid design space exploration & model updates; future includes coupling the structural model & CFD solver to compute the unsteady aerodynamic loads & implementation of a robust optimization framework

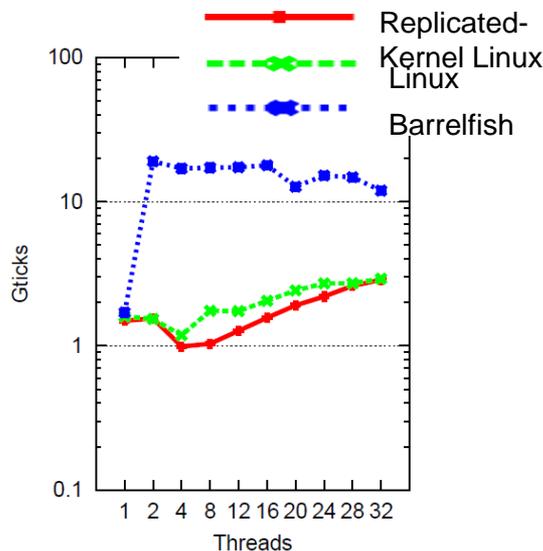

# Scalable, Fault-Tolerant Operating System for Many-core and Multicore Platforms

Dr. Binoy Ravindran, Virginia Tech

**Problem:** Hardware failures are increasing with the increasing core count of multicore architectures; current OSs are not resilient to transient and fail-stop hardware failures, causing critical software infrastructure failures

**Approach:** Two-pronged approach to develop OS to tolerate hardware faults: 1) detect transient faults (e.g., memory bit-flips) and recover through replicated OS kernel design; and 2) detect fail-stop CPU failures and recover through transparent migration of OS services from stalled CPUs; Linux-based OS implementations so legacy applications will run unmodified

*CPU fault injection analysis reveals that, in Linux, the entire system crashes 100% of the time!*

Status: First version of replicated-kernel Linux built (scales as well as Linux); automated CPU fault injection framework; prototype GCC TM compiler for OS kernel function instrumentation

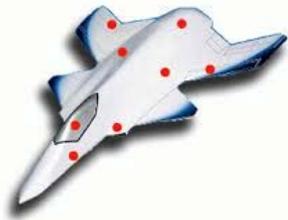

# A Holistic Approach to Networked Information Systems Design & Analysis

*Dr. P. R. Kumar, Texas A&M University*

Problem: Fly-by-wireless; real-time wireless networks for connecting on-board sensors and actuators; communication and computational constraints; uncertainty at several layers; complex and interdependent systems

Approach: Design scheduling algorithms to operate under hard deadlines, guarantee timely throughput & minimize energy usage; also design methodology for precise characterization of performance

# Conclusion

- Basic research is an engineering process in that it solves the general problem of generating a higher R&D response
  - Basic research S&Es should always have this clearly defined **exit strategy** in mind
- With respect to technology readiness levels (TRLs), basic research has this requirement; TRL 1 states:
  - “Scientific research begins to be translated into applied research and development (R&D)”
- There must be:
  - **Trade-offs** in basic research that have been discussed, but not routinely placed in practice
  - A **balance** between innovative research and product development
