

# A Developing Science of Cyber Security – an Opportunity for Model Based Engineering & Design

October 26, 2017

Jerry M. Couretas, PhD

# About Me - Cyber Modeling and Simulation

- 2016 – present OSD C3CB Cyber Mission Model and Economics of Cyberspace Performance Working Group Lead
- 2013 – 2016 Coordinated OSD DM&SCO Cyber M&S Technical Working group for
- Editor-in-Chief of the Journal of Defense Modeling and Simulation
  - 7/2017 Cyber M&S Special Issue
  - 1/2018 Cyber Special Issue on Developing Science of Cyber Security

# Hackers Are Targeting Nuclear Plants, U.S. Says

By NICOLE PERLROTH

Since May, hackers have been penetrating the computer networks of companies that operate nuclear power stations and other energy facilities, as well as manufacturing plants in the United States and other countries.

Among the companies targeted was the Wolf Creek Nuclear Operating Corporation, which runs a nuclear power plant near Burlington, Kan., according to security consultants and an urgent joint report issued by the Department of Homeland Security and the Federal Bureau of Investigation last week.

The joint report was obtained by The New York Times and confirmed by security specialists who have been responding to the attacks. It carried an urgent amber warning, the second-highest rating for the severity of the threat.

The report did not indicate whether the cyberattacks were an attempt at espionage — such as stealing industrial secrets — or part of a plan to cause destruction. There is no indication that hackers were able to jump from their victims' computers into the con-

The Wolf Creek nuclear plant in Kansas in 2000. Its operator was targeted by hackers.

cause of confidentiality agreements.

The origins of the hackers are not known. But the report indicated that an "advanced persistent

directed their victims' internet traffic through their own machines.

Energy, nuclear and critical manufacturing organizations

"We never anticipated that critical infrastructure control systems would be facing advanced levels of malware," Wellinghoff said.

# The Scientific Underpinnings of Cybersecurity<sup>1</sup>

A science of security will develop

- a body of scientific laws
- testable explanations
- confirmation or validation of predicted outcomes

CyVision  
Network  
Layout

1 2 3 4 5  
Plaster casts made in European detective laboratories in order to study crime scientifically

# Scientific Approach to Cybersecurity

There are strong and well-developed bases in the contributing disciplines:

- mathematics and computer science
- human sciences<sup>1</sup>

A scientific approach to cybersecurity challenges expands understanding of

- systems
- defenses
- attacks
- adversaries

<sup>1</sup> <https://www.amazon.com/Research-Methods-Cyber-Security-Thomas/dp/0128053496>

# National Academy of Science & Cyber Research

## Findings included

- Interdisciplinary program examples – U of Bochum
- Questions current research
  - High frequency publishing vs quality
  - Enabling results
- Longer research projects may help

# Example Transitions from Art to Science

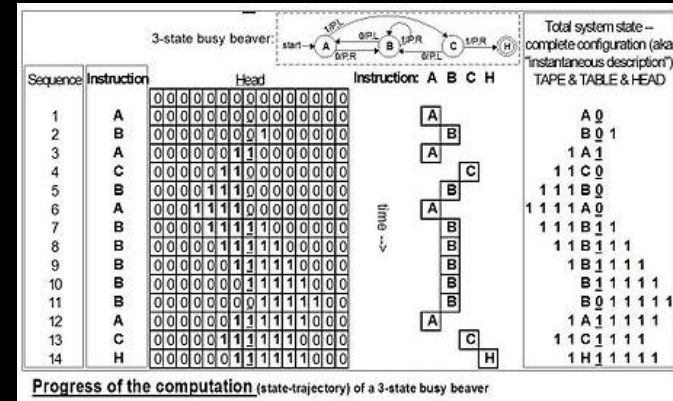

- **Cyber Security Science**

- 1700s– 1960s – complex industrial systems with integrated timing handled by respective operators
- 1960s – 1980s – Systems Theory (e.g., Wymore, Zeigler ...) texts introduced
- 1990s – 2000s – micro computers increased number of entities to point where scale and scope of new systems introduce overall security / safety issues
- Early 2000s – present – “cyber” introduced as topic in security circles
- Next step ?

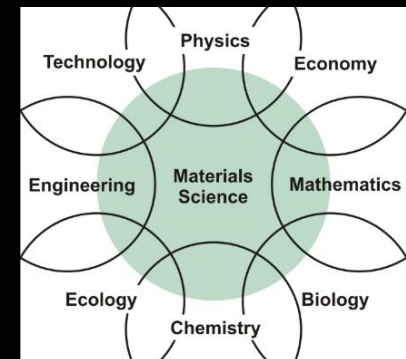

- **Computer Science**

- Pre History – 1930s – “computer” was a person who used various devices (e.g., Abacus, analytical engine, etc.)
- 1930s – 1950s – algorithms (e.g., Church-Turing, ...), N. Wiener’s “Cybernetics,” identified as independent domain
- 1950s – 1970s – development of computer science curricula and specialized literature (e.g., first PhD ~ 1965)
- 1970s – present – “Computer Science” with provable hypotheses

- **Material Science**

- Pre History to 17<sup>th</sup> Century – Alchemy
- 17<sup>th</sup> Century – 1960s – Metallurgy
- 1960s – present - Material Science
- Still recipe based

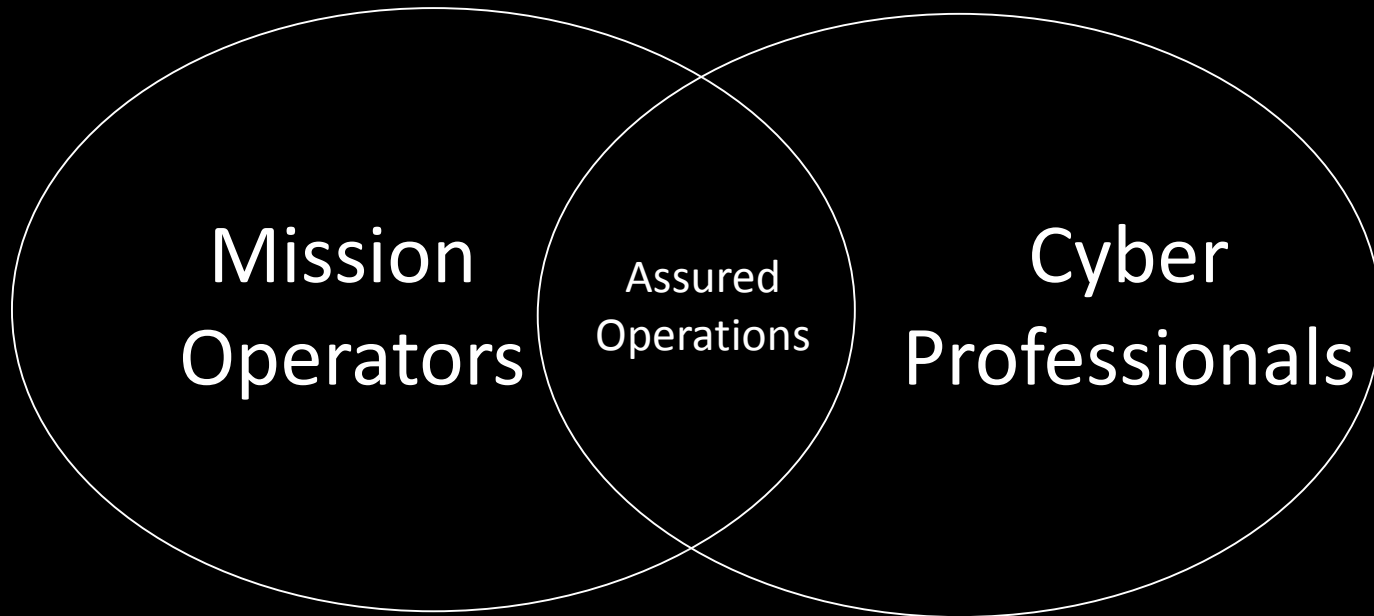

We have built high risk, complex systems, for new domains

Hard Problems are what M&S is For

# 2015 Business Blackout

Lloyd's of London  
scenario looked at a  
U.S. power grid failure

... and, while a major cyber attack is unlikely ...

Cyber attacks, including against industrial control systems, are a continuing phenomena

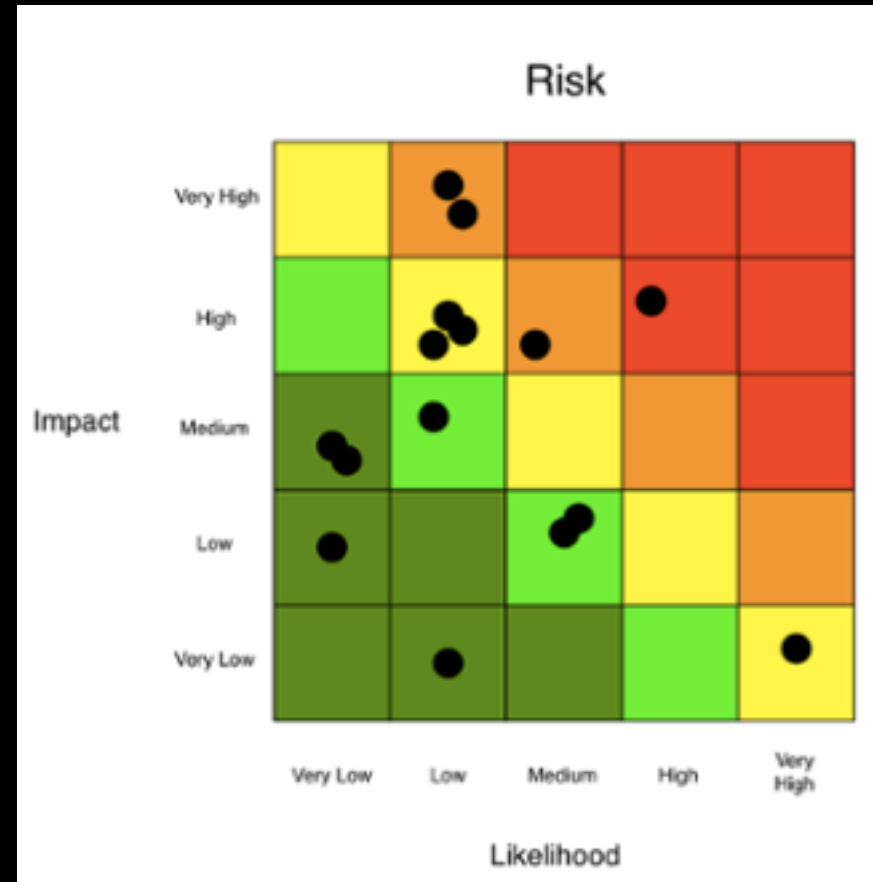

Date	Event name	Detailed description	Actors	Motivation	Methodology	Outcome
April 1999 (Mihom, 2007)	<b>Gazprom – Russian gas supplier</b>	A Trojan was delivered to a company insider who opened it deliberately. The control system was under direct control of the attackers for a number of hours.	Targeted Attack & Insider	Sabotage & Ransom	Trojan & Insider	Unauthorised Access.
July 1999 National Safety Transport Board, 2002 (Wilshusen, 2007)	<b>Bellingham</b>	Over 250,000 gallons of gasoline leaked into nearby creeks and caught on fire. Large amount of property damage, three deaths and eight others injured. During the incident the control system was unresponsive and records/logs were missing from devices.	Accident	Unknown	Accidental	Physical Damage and Bodily Injury
Feb. and April 2000 (Ill. Slav, 2008) (Wilshusen, 2007)	<b>Maroochyshtire</b>	A recently fired employee sabotaged radio communications and released 800,000 gallons of raw sewage into parks, rivers and the grounds of a hotel.	Insider attack	Sabotage	Radio man-in-the-middle	Physical Damage
May 2001 (US House of Representatives, 2005 (SCADA) <sup>TM</sup> Systems and the Terrorist Threat: Protecting the Nation's Critical Control Systems, 2005	<b>California</b>	A hacking incident at California Independent System Operator (CAISO) lasted two weeks, but did not cause any damage.	External attack	Unknown and contained	Deliberate	Thwarted
August 2005 (GAO Report, 2007)	<b>Daimler-Chrysler</b>	Thirteen Daimler-Chrysler US auto manufacturing plants were taken offline for about an hour by an internet worm. An estimated \$14m in downtime costs.		Spyware Installation	Zotob Worm and MS05-039 Plug-n-Play	Infection
	<b>Brown's Ferry</b>	Loss of recirculation flow on a US nuclear reactor down for maintenance caused a manual scram. A worm exploited a buffer overflow flaw in the widely used MSSQL server during the scram.		Unknown	Skammer Worm and Buffer Overflow	Non-industrial control systems targets
Oct. 2006 (Wilshusen, 2007)	<b>Harrisburg</b>	Hackers gained access to a water treatment plant through an infected laptop.	Targeted Threat Agent	Mischief	Compromised Laptop	Server used to run online games
Jan 2008 (Moras, 2012)	<b>Lodz</b>	Attacker built a remote control device to control trains and trucks through distributed field devices. Four trains were derailed with zero deaths. A disgruntled employee installed malicious code on a canal control system.	Targeted Threat Actor, Accident or Insider Attack	Mischief	Altered Universal Remote	Mayhem, Criminal Damage
Jan 2008 (Knappin, 2008)	<b>Kingsnorth</b>	Attacker broke into the E.ON Kingsnorth power station which caused a 500MW turbine to take an emergency shutdown.	Targeted Threat Actor	Sabotage	Physical Penetration	Environmental Incident

# Insurance Concepts & Systems Engineering for Cyber

- Böhme & Schwartz (2010) provide an excellent summary of cyber insurance literature and define a unified model of cyber insurance that consists of 5 components:
  - the networked environment
  - demand side
  - supply side
  - information structure
  - organizational environment
- In addition, the defining characteristics of cyber insurance are
  - interdependent security
  - correlated failure
  - information asymmetry

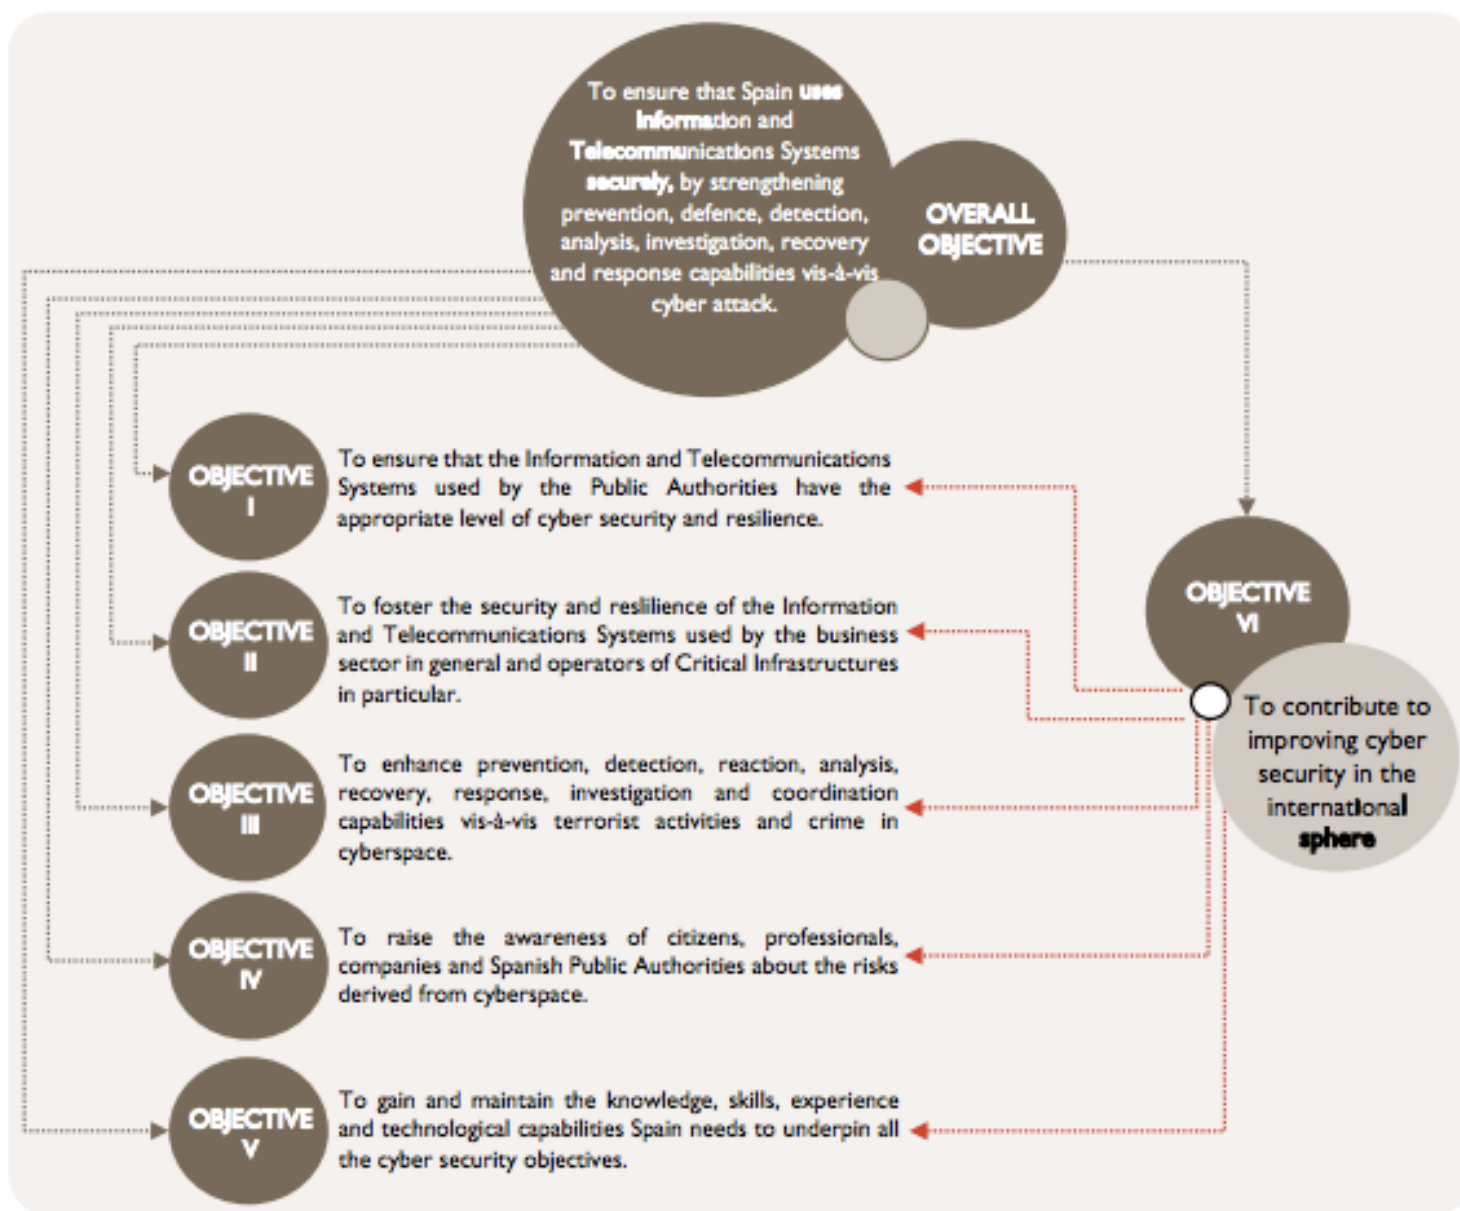

# Example Cyber Measurement Models

# Enterprise Model

People manage enterprise due to the scope of information

The image shows a large, complex grid or matrix diagram. It consists of a large square grid of small cells, with a diagonal line of larger, darker cells running from the top-left to the bottom-right. The grid is surrounded by text and labels, which are too small to read clearly. The overall appearance is that of a detailed data structure or organizational chart.

<sup>1</sup> <http://www.itl.nist.gov/div898/handbook/apr/section1/apr161.htm>

# Enterprise Model Construction & Evaluation

## Authoritative Data

- 2013 OT&E AR
- Verizon report
- McAfee / Symantec

## Data to Rates

- Annual Occurrences

## Strategy Alternatives

- Cost
- Timeliness
- Effectiveness

"As Is" Enterprise Risk Model

Strategy Evaluation

- ← Policy
- ← Training
- ← Technology

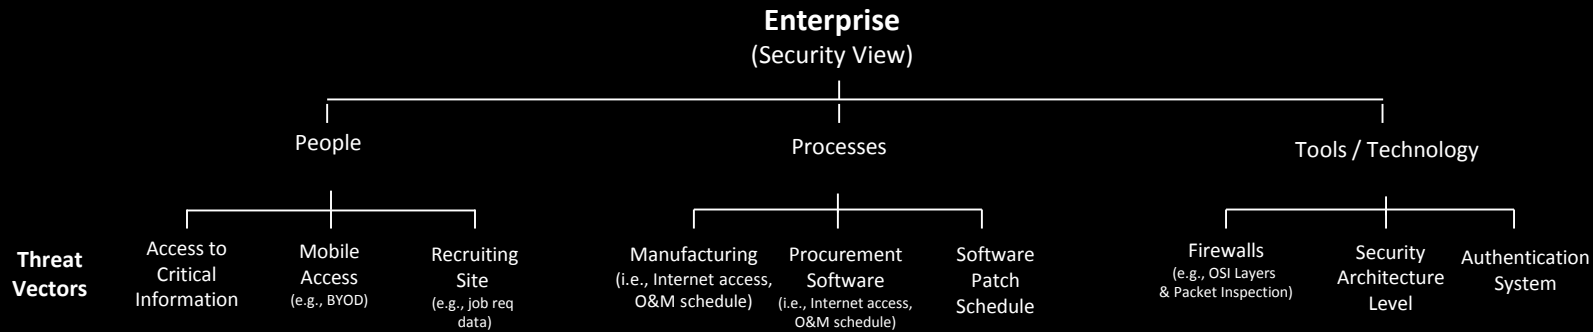

## Metrics

- Dollar quantifiable (e.g., Target, Nieman Marcus ...)
- Media quantifiable (e.g., Snowden, Manning) – number of articles / exposure

# Enterprise Model

(Populate with known Data)

People, Processes & Tools from Surveys / Interviews

Q&A to Static Enterprise Model

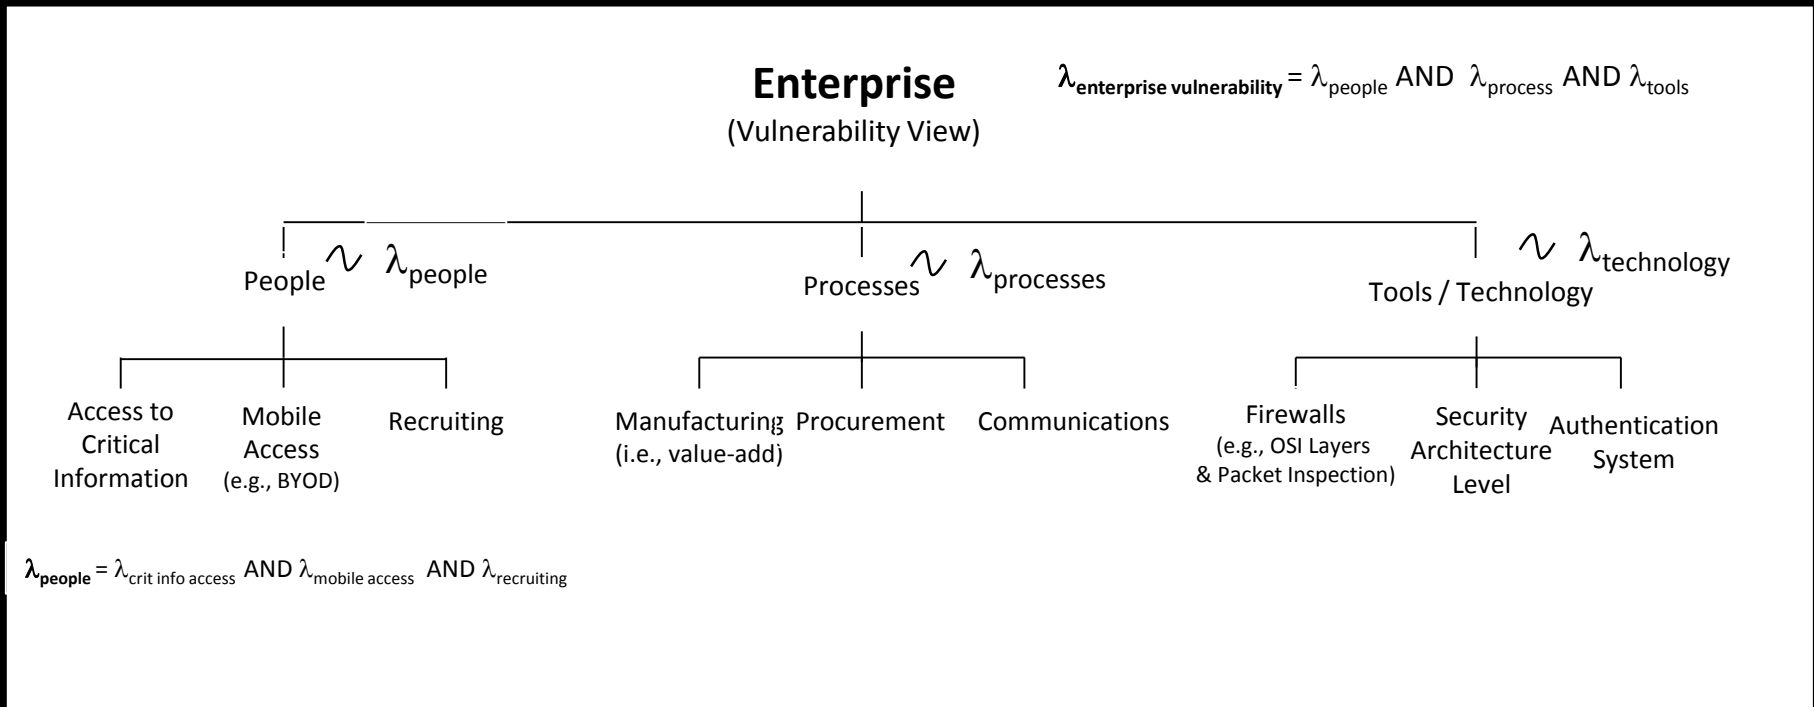

**Use the Q&A process to develop an information structure amenable to modeling:**

	People	Processes	Tools
Who	<ul style="list-style-type: none"> <li>System Access</li> </ul>		<ul style="list-style-type: none"> <li>User Authentication</li> </ul>
What	<ul style="list-style-type: none"> <li>Personally Identifiable Information (PII)</li> <li>Social Media</li> </ul>	<ul style="list-style-type: none"> <li>Critical Information</li> <li>High Volume (e.g., manufacturing)</li> </ul>	
When	<ul style="list-style-type: none"> <li>System Access</li> </ul>	<ul style="list-style-type: none"> <li>Maintenance Schedule</li> <li>Patch Schedule</li> <li>Software Updates</li> </ul>	
Where	<ul style="list-style-type: none"> <li>Fixed Site</li> <li>Mobile</li> </ul>		
Why	<ul style="list-style-type: none"> <li>Business System access</li> <li>Technology System Access</li> </ul>		<ul style="list-style-type: none"> <li>Secure Sockets Layer (SSL)</li> </ul>
How	<ul style="list-style-type: none"> <li>Recruiting</li> <li>Screening</li> </ul>		<ul style="list-style-type: none"> <li>Security Architecture Level</li> <li>Firewall – monitoring &amp; control</li> </ul>

# Enterprise Model & Parameterization

(organize respective failure rate estimates)

- $\lambda$  is the failure rate for the respective domain (e.g., people, process, tool) or one of its components
- Exponential distribution results in “additive” combination of failure rates over the heterogeneous data for the respective domains

# “As Is” Risk Estimation

(Strategy – “Do Nothing”)

Time (months) vs. Mean Time to Exploit

(MTTE)

(Strategy : Do Nothing)

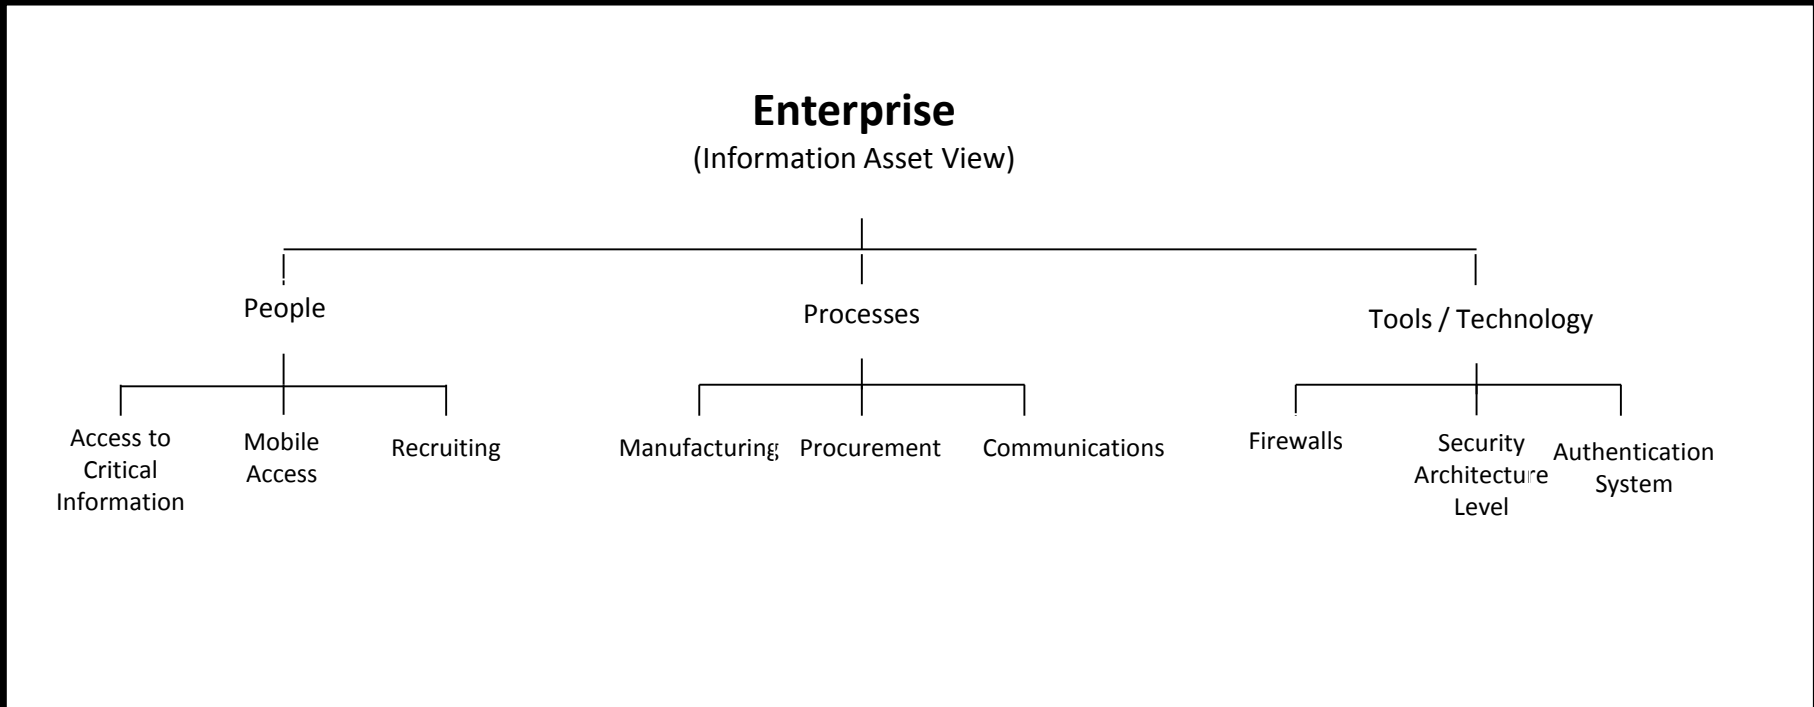

# Example Countermeasures as Work Packages

Packages / Domain & Work Package		Cyber Enterprise Domain Affected by Work Packages			Work Package Time / Cost Estimate	
Work Packages		People ( $\lambda_{\text{people}}$ )	Process ( $\lambda_{\text{process}}$ )	Tool ( $\lambda_{\text{tool}}$ )	Implementation Time	Cost (\$ K)
	Access	●	○	○	months	10's
<b>Policy</b>	Mobile Device	●	●	●	months	10's
	Critical Information	●	●	○	months	10's
	Phishing	●	○	○	weeks	10's
<b>Training</b>	Internet Use	●	○	○	weeks	10's
	Social Engineering	●	●	○	weeks	10's
	Firewalls	○	●	●	days	100's
<b>Technology</b>	M&C	○	○	●	days	100's
	Authentication	●	○	●	weeks	100's

- Work Packages provided as policy / training / technology “fixes” and affect cyber enterprise domains (i.e., people, processes and tools) independently
- Independent Work Package provision results in ready project plans in terms of time and cost estimates for improving enterprise resilience

# Two major subspaces of cyber M&S problems

# MITRE & ATT@CK Framework<sup>1</sup>

- ATT@CK provides decomposition of cyber attack cycle
- CARET<sup>2</sup> expands ATT@CK to give more context on tactics, tools and threat groups

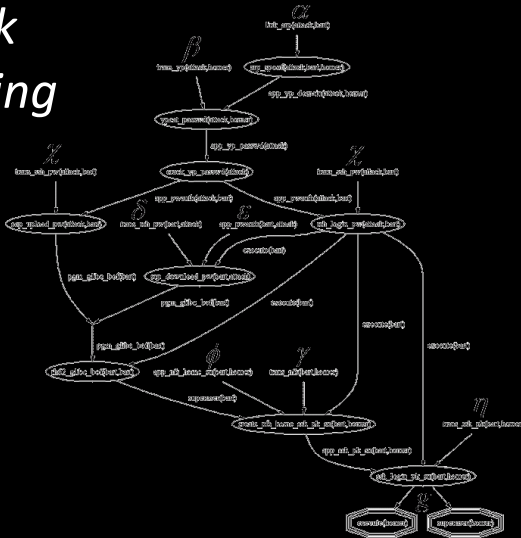

The screenshot shows the CARET interface with a detailed grid of ATT&CK tactics and techniques. The grid is organized into columns for various categories: Command and Control, Exfiltration, Credential Access, Persistence, Collection, Defense Evasion, Discovery, Privilege Escalation, Lateral Movement, and Execution. Each cell in the grid contains a specific tactic or technique name, such as 'Data Obfuscation', 'Data Compression', 'Credential Dumping', 'Winlogon Helper DLL', etc. The interface also includes search and filter options on the left side.
