

# ***SUPERVISED AUTONOMOUS FUNCTION EXECUTIVE SAFE™***

An Autonomy Enabler

UNCLASSIFIED DISTRIBUTION UNLIMITED

**MTSi**  
MODERN TECHNOLOGY SOLUTIONS, INC.®

Innovative Technical Solutions for the 21st Century

# THE PROBLEM

## How do we certify?

Artificial  
Intelligence

Machine  
Learning

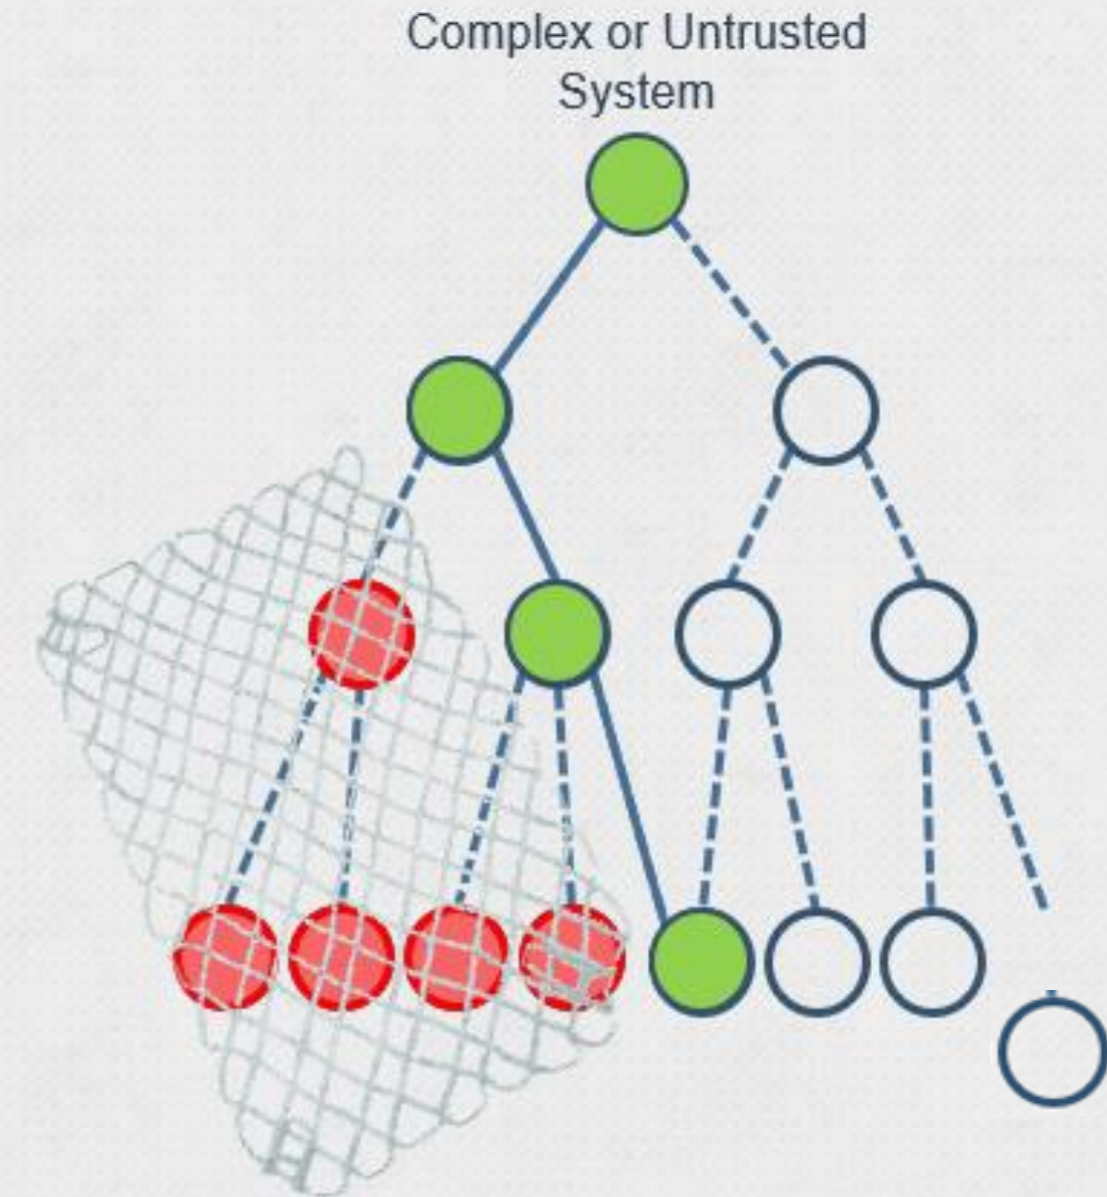

DoD Artificial Intelligence Principals:  
Responsible, Equitable, Traceable, Reliable, **Governable**

## Supervised Autonomous Function Executive (SAFE™)

Simple and deterministic Multi-Monitor Runtime Assurance  
software that restricts vehicle from violating user selected  
criteria

A safety net around untrusted systems.

- MTSI was imbedded with NASA team during development of Expandable Variable Autonomous Architecture (EVAA)
- EVAA has flown on several aircraft since 2010 and the basic Ground Collision Avoidance algorithms are fielded on F-16/35
- MTSI has a Software Usage Agreement with NASA
- MTSI has HWIL/SWIL conducting independent evaluation and is improving/maturing the software

## Performance Based Certification

F-16 Auto GCAS & ACAS

AvSP

Resilient Autonomy

Joint Capability Technology Demonstration

UTM & SASO

2018 Collier

NASA

Industry

Autonomy Safety Standards

DoD

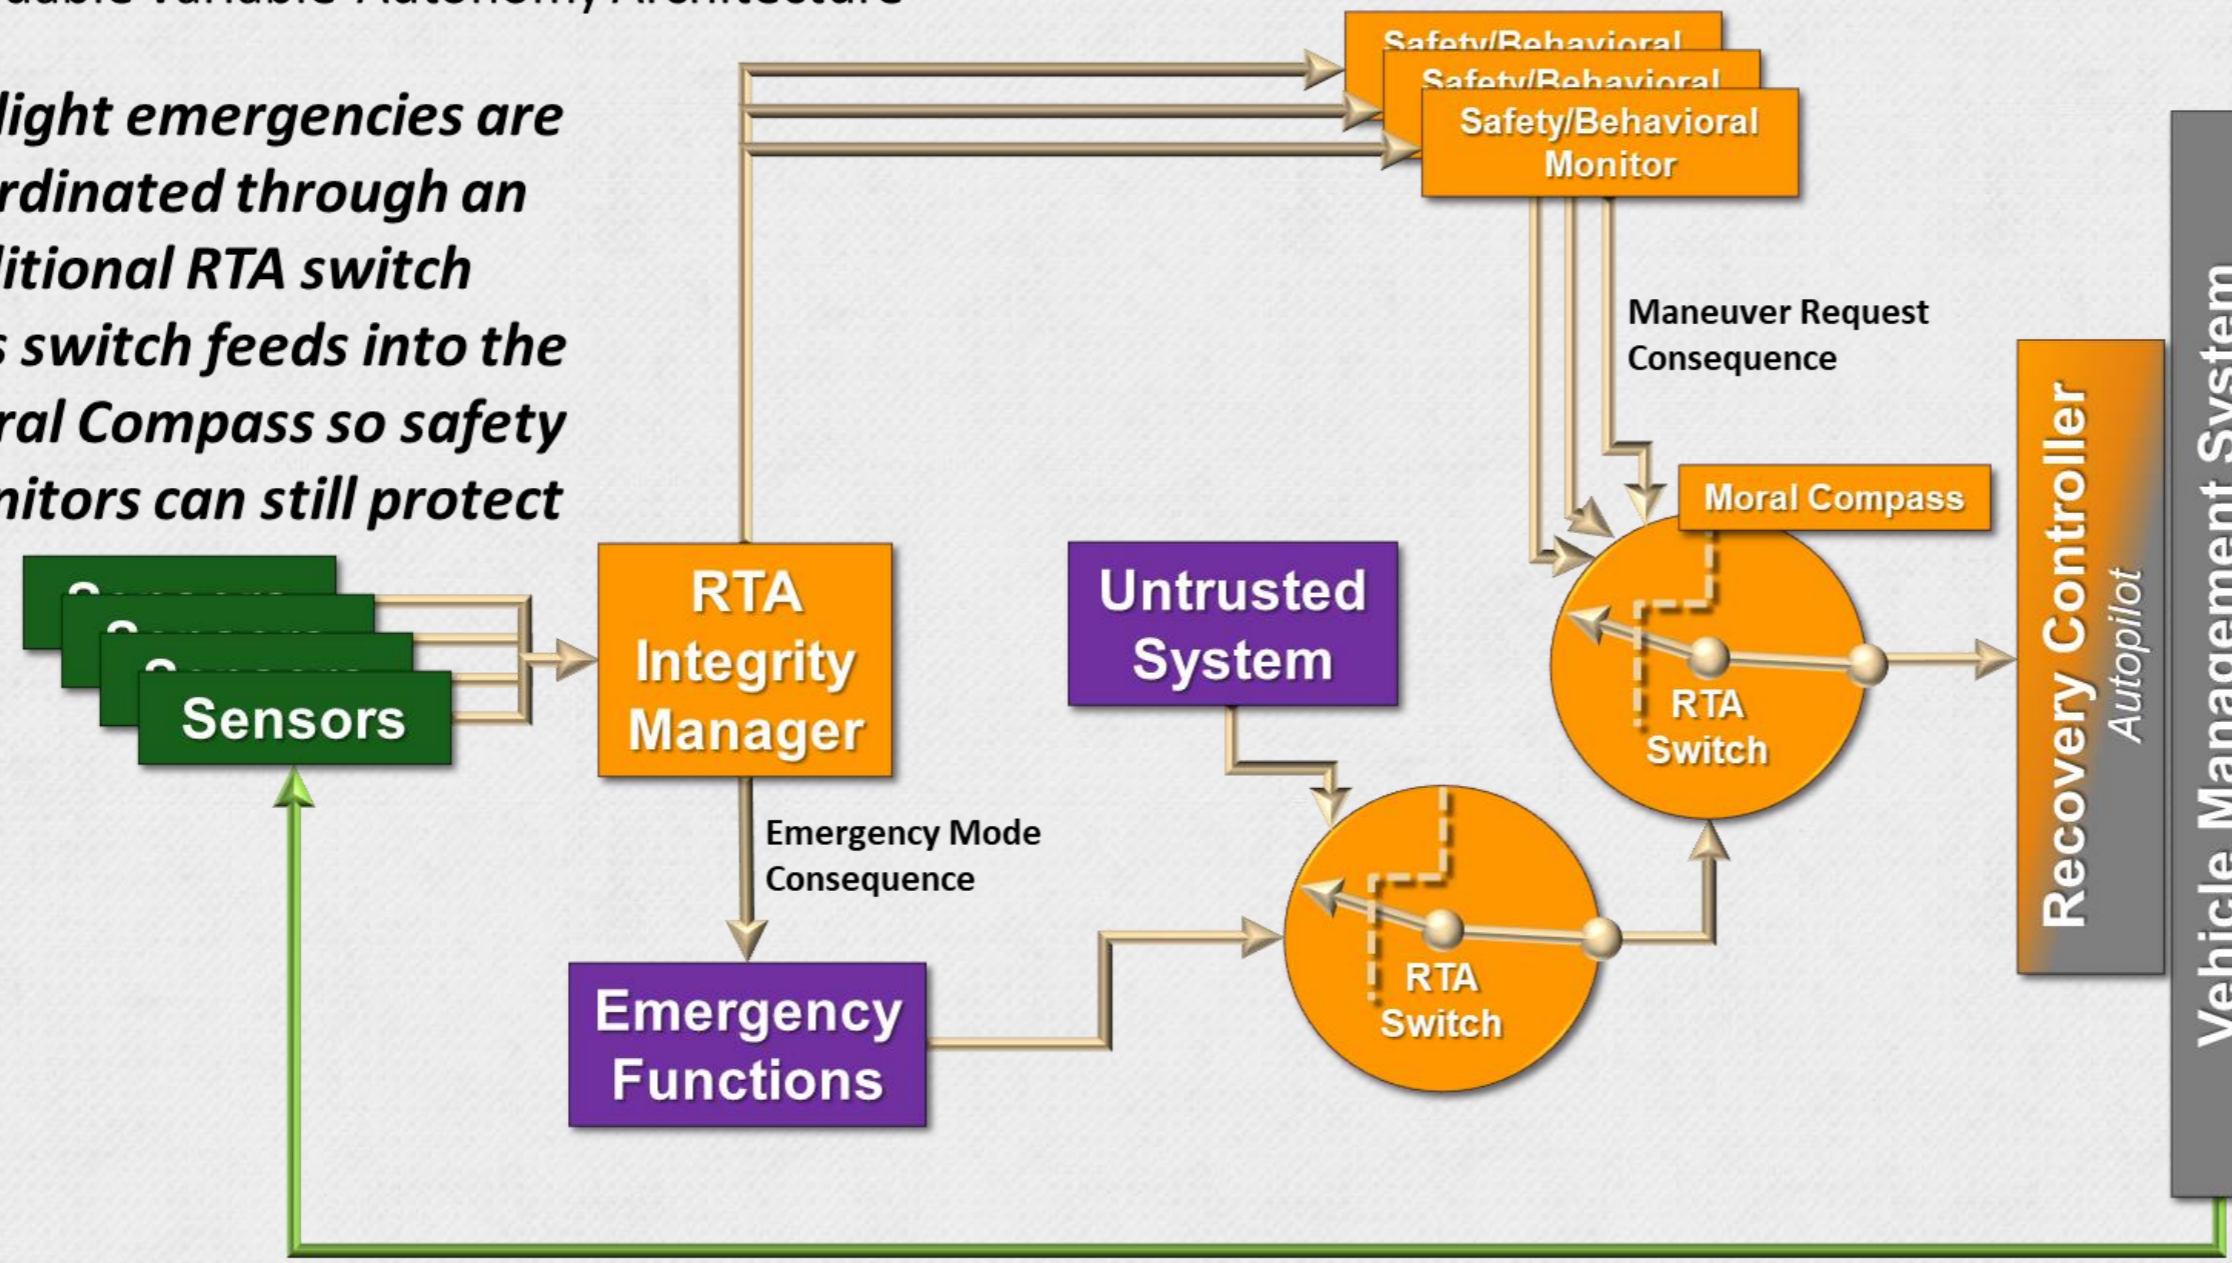

## Reference Implementation Development

## EVAA Phase 2 : Current Work

Expandable Variable-Autonomy Architecture

- **In-flight emergencies are coordinated through an additional RTA switch**
- **This switch feeds into the Moral Compass so safety monitors can still protect**

## RTA Network

EVAA Phase 2 : 2020-21  
Resilient Autonomy JCTD

### Legend

- RTA Trusted Functions
- Untrusted Controllers
- Baseline Aircraft
- Sensors

- **Microservices**
  - Easily scalable by adding more hardware
  - Publish / Subscribe means adding new services is easy and painless.
- **Robust**
  - Multiple Processes
    - If a component crashes, then all other components still work as intended.
  - Self-Healing by using heartbeats & hardware watchdogs.
- **Built using modern C++ best practices.**
  - Static Analyzers help detect bugs before they become an issue.
  - RAI handles memory management instead of the developer.
    - Eliminates an entire class of bugs.
- **Built with formal requirements**

- **SAFE™: Government owned software**
- **Demonstrated capabilities:**
  - **Ground Collision Avoidance**
  - **Air Collision Avoidance**
  - **Weather Avoidance**
  - **Forced Landing**
- **Architecture adaptable to ground systems**
- **MTSI flight demo planned for CY22**
- **Artificial Intelligence certification enabler**
- **Per NASA Software Usage Agreement, continued development/integration requires government sponsor**
