Digital Mission Engineering Vision

(All Depicted Data is Notional)

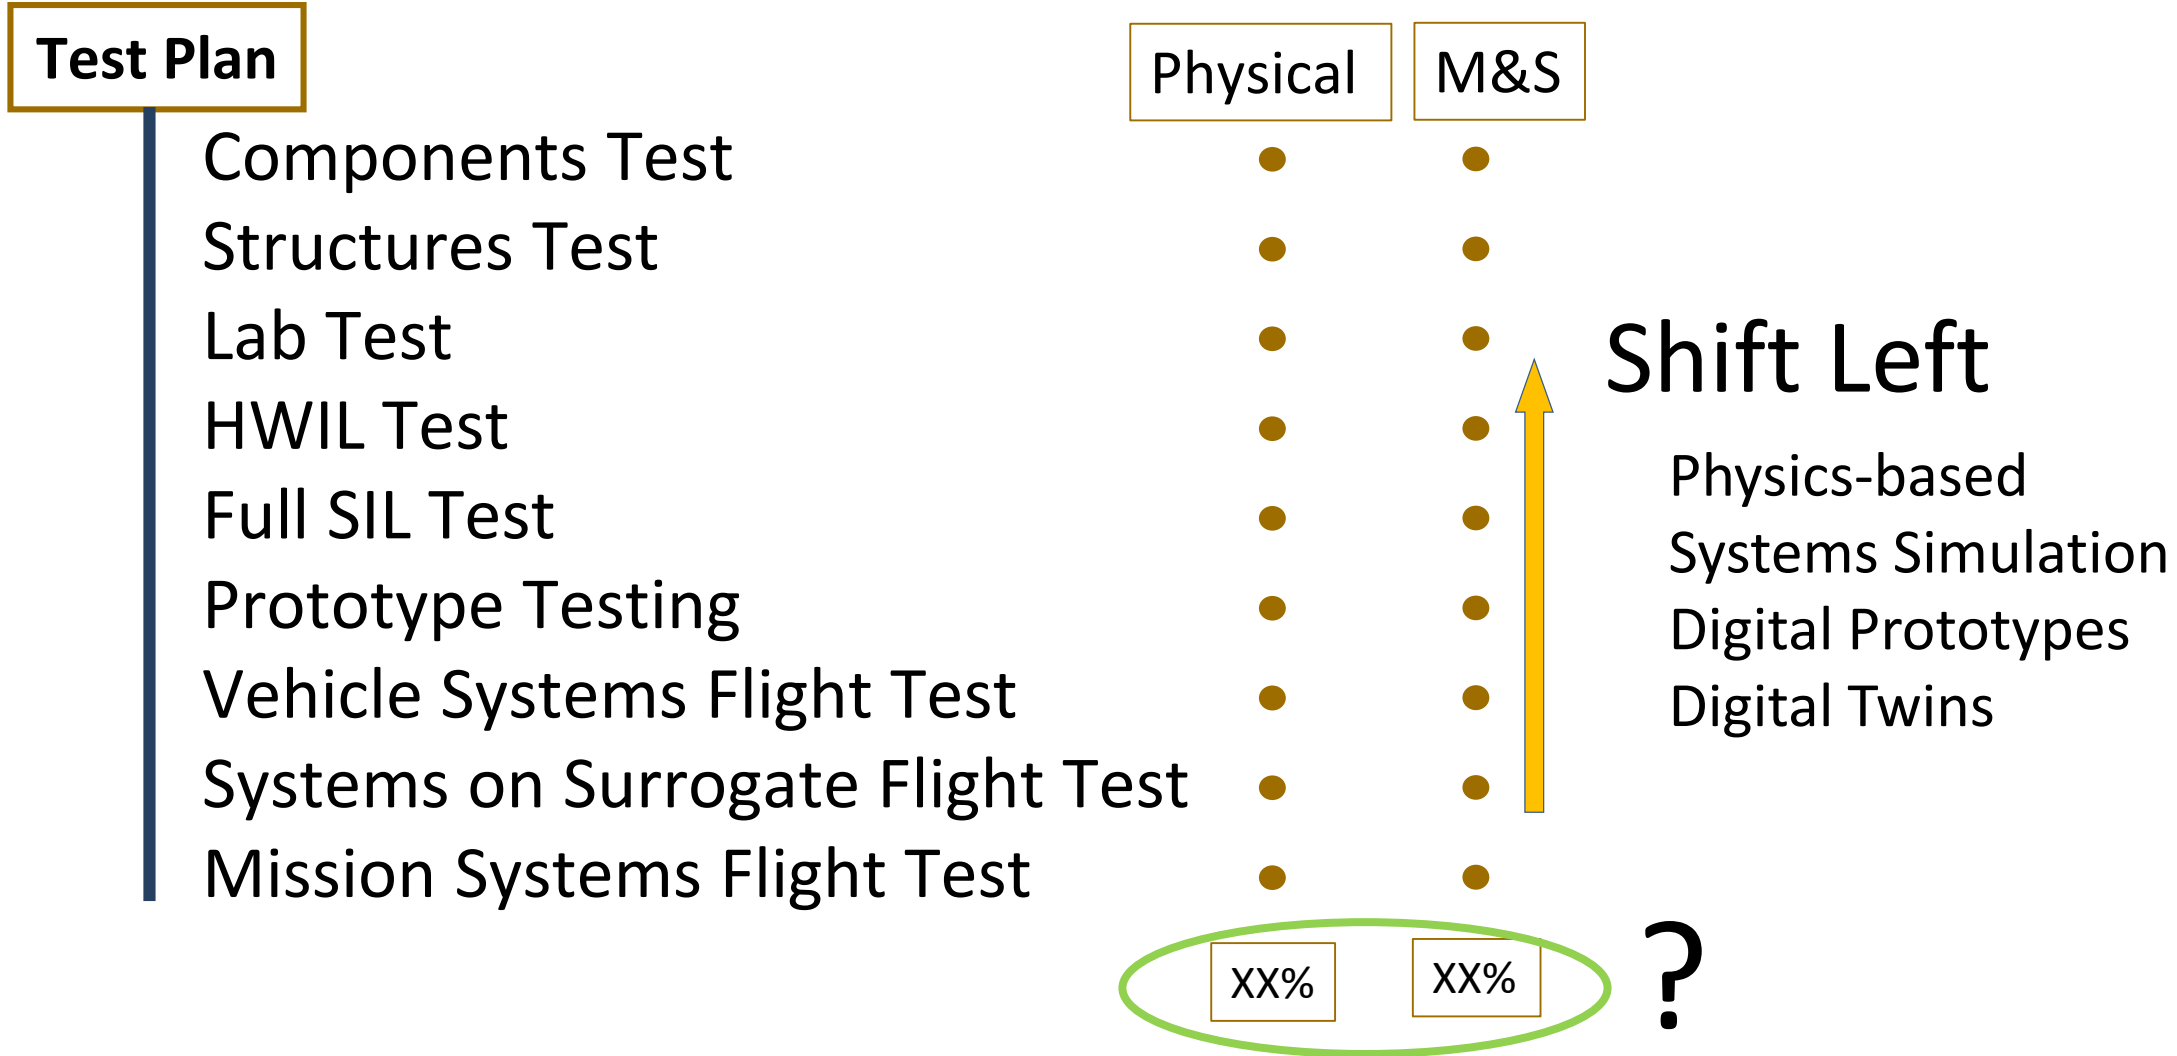

Overall Test Plan – Incorporation of Modeling

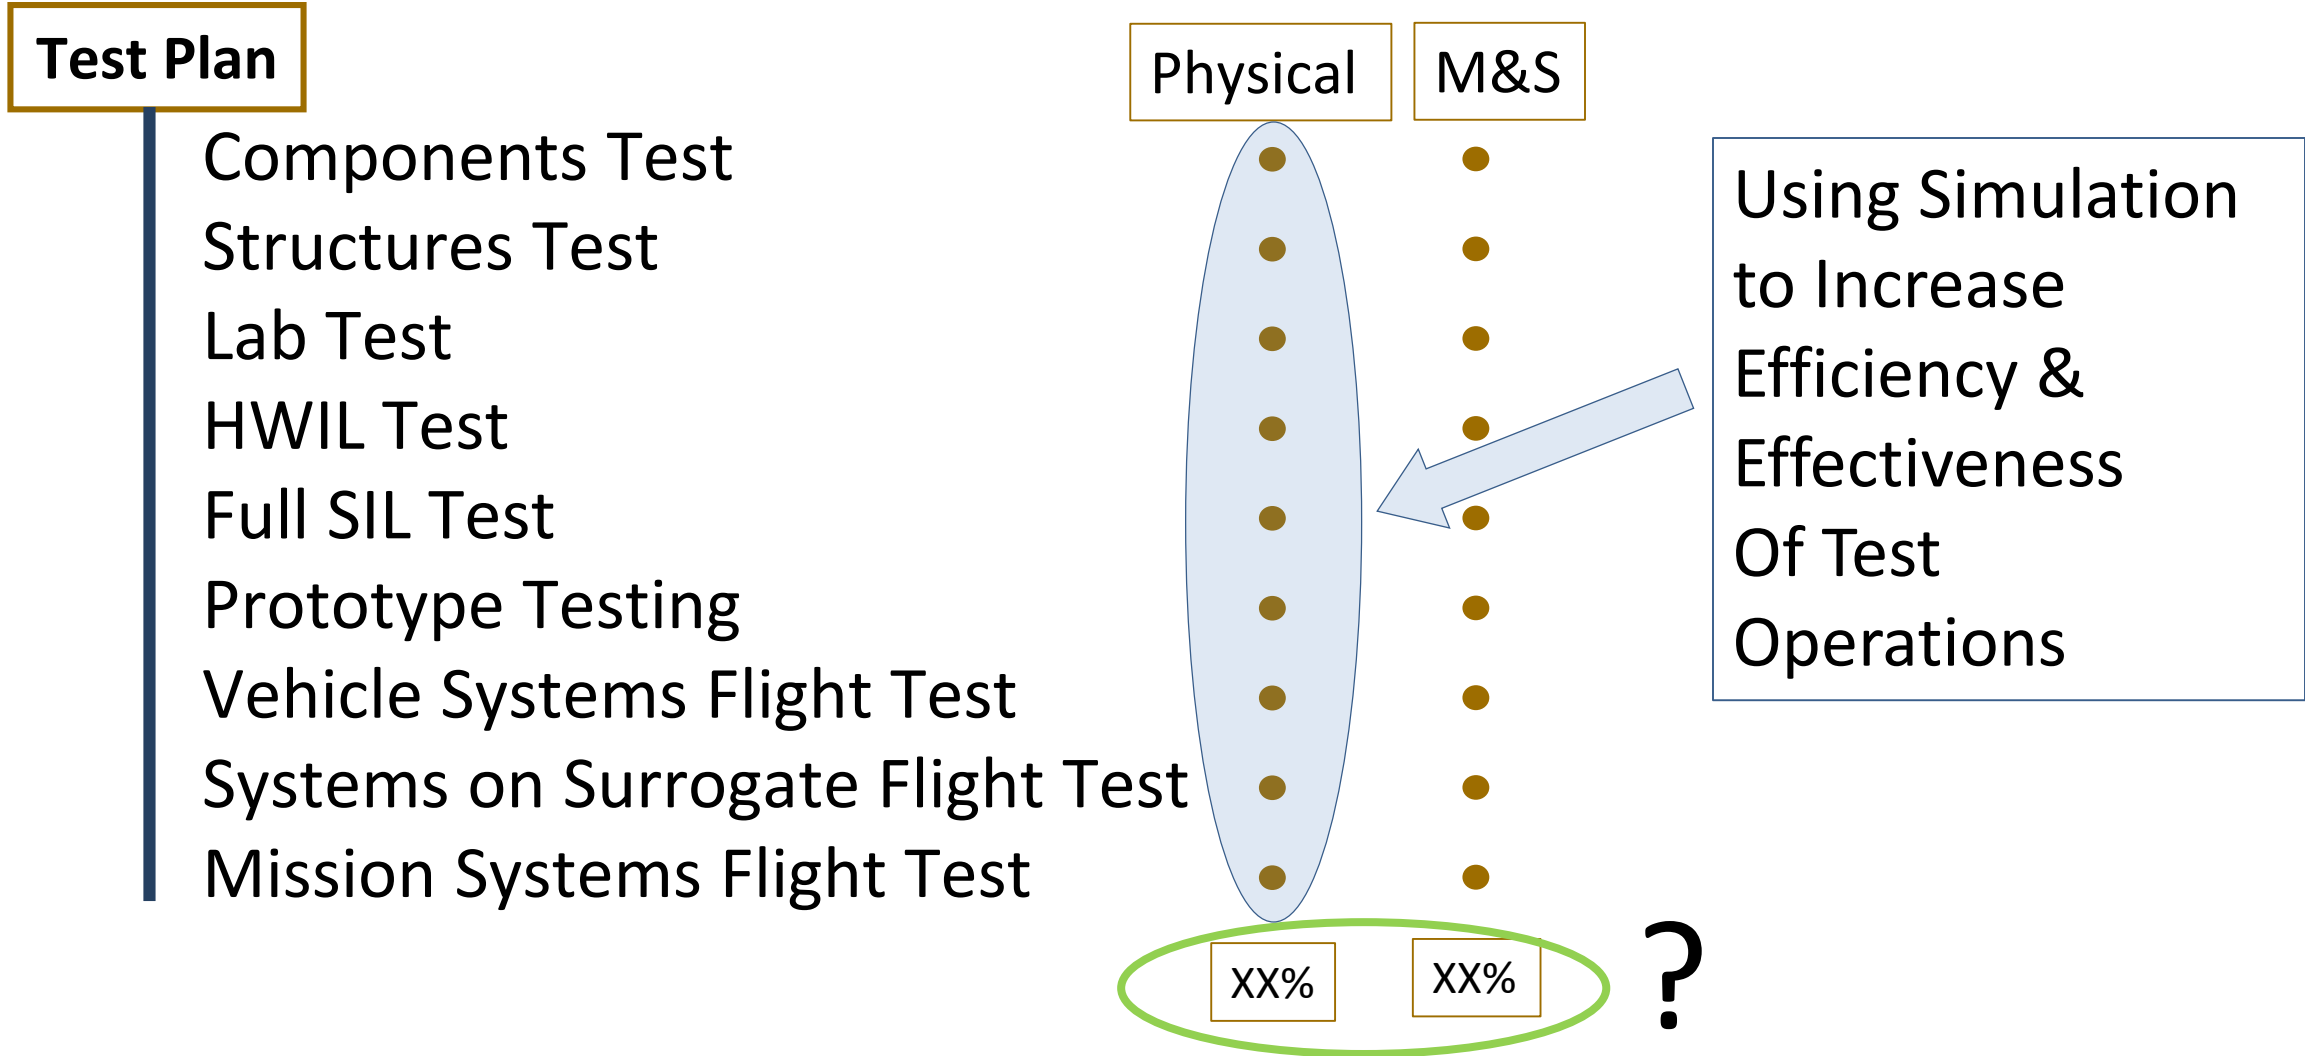

Test Plan	Physical	M&S
Components Test	●	●
Structures Test	●	●
Lab Test	●	●
HWIL Test	●	●
Full SIL Test	●	●
Prototype Testing	●	●
Vehicle Systems Flight Test	●	●
Systems on Surrogate Flight Test	●	●
Mission Systems Flight Test	●	●
	XX%	XX%

?

Overall Test Plan – Incorporation of Modeling

Overall Test Plan – Incorporation of Modeling

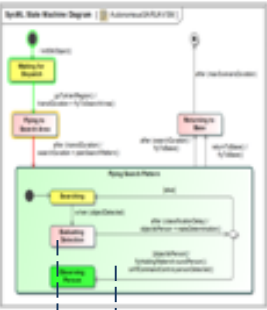

Challenges to Digital Transformation

- Testing the MBSE Designs for:
 - Correctness - Accuracy - Completeness - Cohesiveness
- Designing the proper Test Plan DOEs considering all relevant factors and MBSE designs
- Build up of fully representative “Digital Twins”
 - Components >> Vehicle >> System >> System-of-Systems
- Enablement of engineering & mission physics based simulations to be used by execution-phase test-practitioners
- Enabling the validation of models built into the execution test process
 - Model – Test – Evaluate – Refine – Model

Effective MBT&E tied in Early and Throughout Program

MBSE

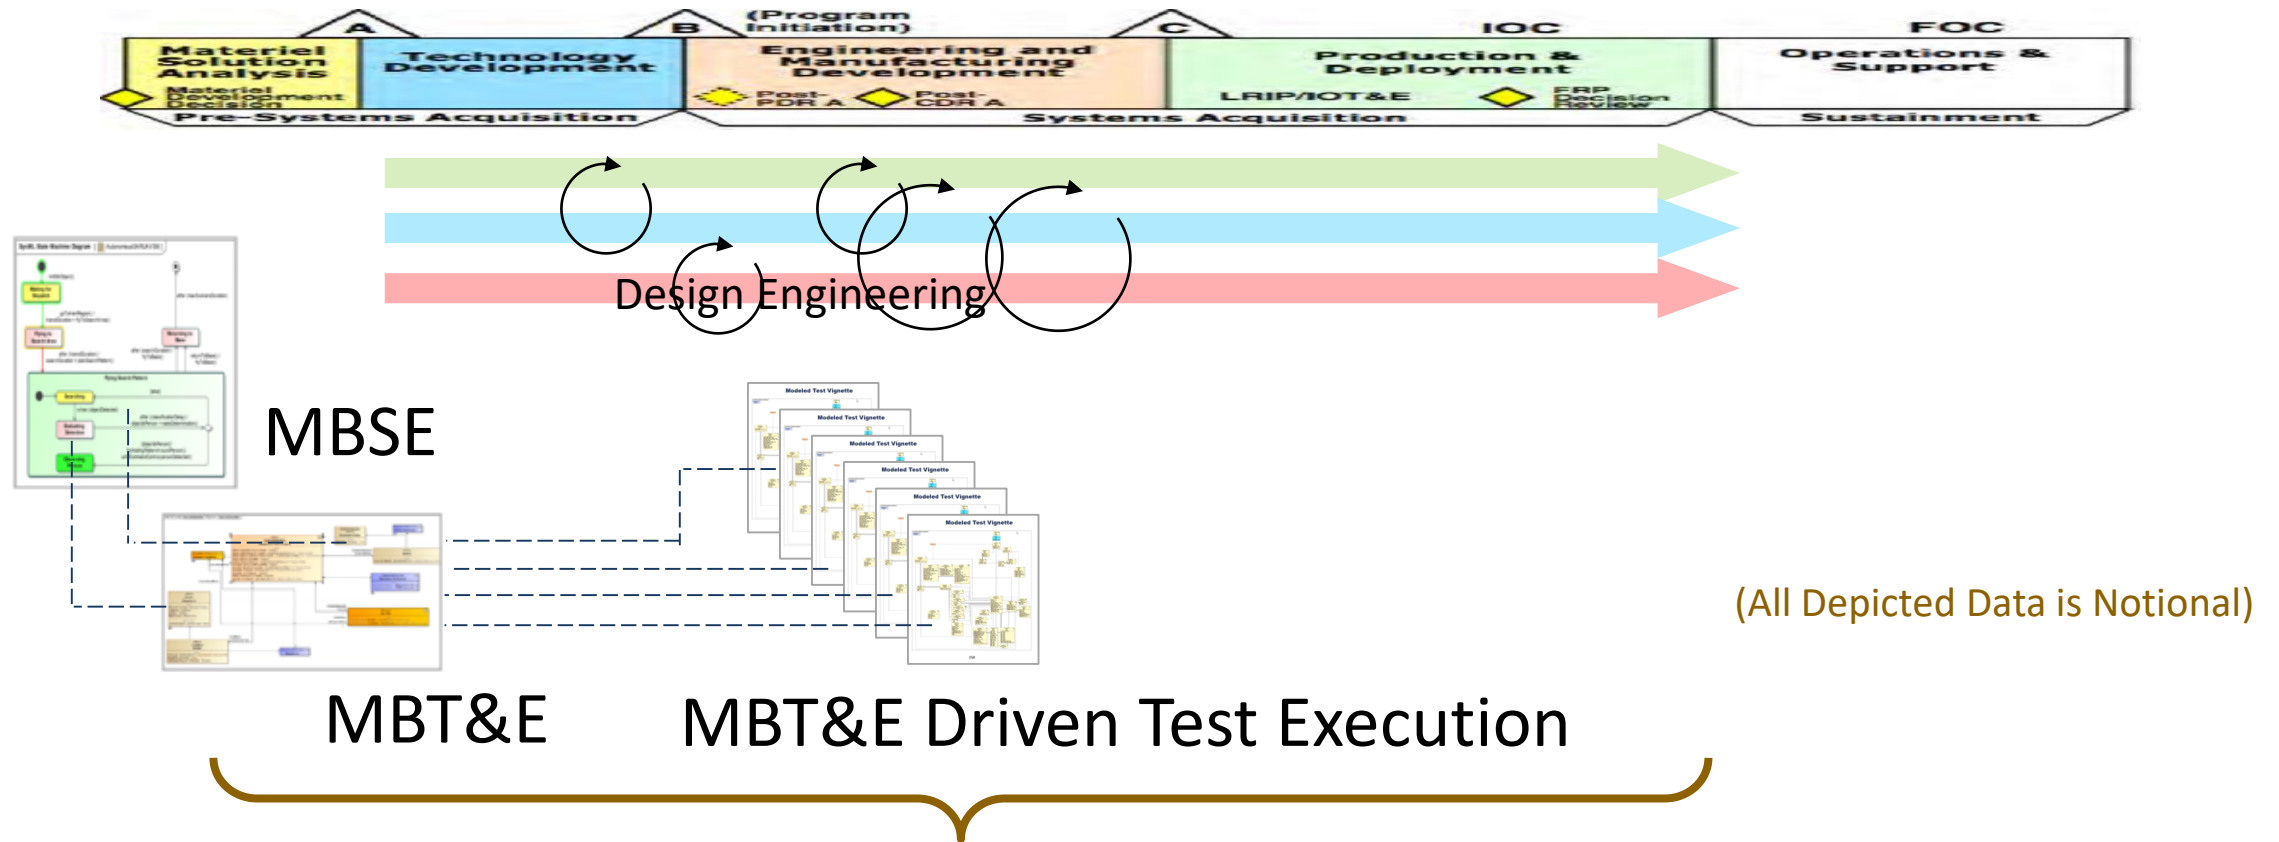

MBT&E

MBT&E Driven Test Execution

(All Depicted Data is Notional)

Effective MBT&E tied in Early and Throughout Program

Programmatic Evolution of Digital Twins

Component Twins

Physics Simulation Models

Vehicle Subsystem Twins

Engineering Simulation Models

Systems of Systems Twins

Execution Phase T&E Improvement Opportunity

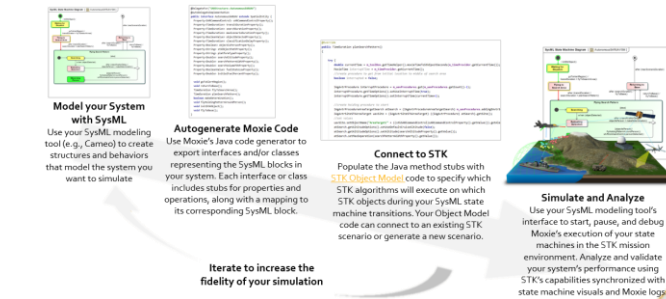

Systems Engineering

T&E Execution

Systems Verification

Data Fusion Analysis

Opportunity to use models generated in the overall DE process into the T&E Execution process for test detailed planning, execution & data analysis

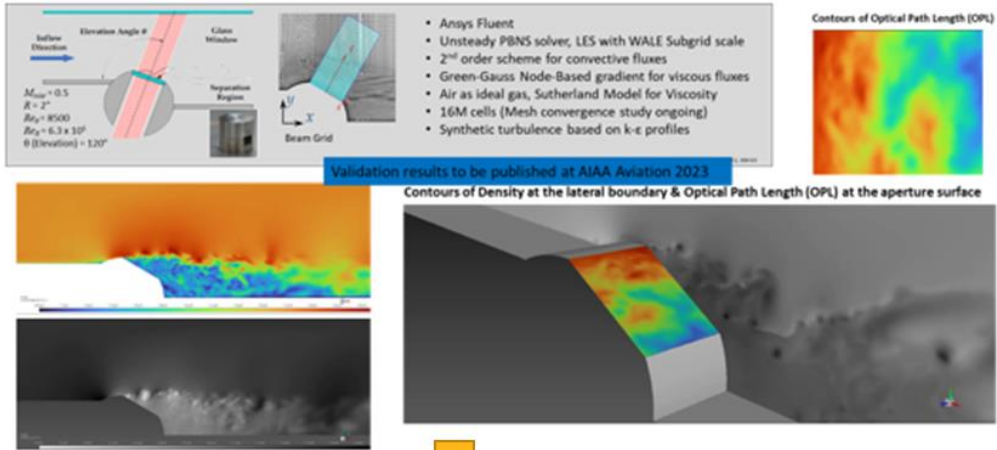

SE Models & Physics/Engineering Models

(model – test – model – test – model ...)

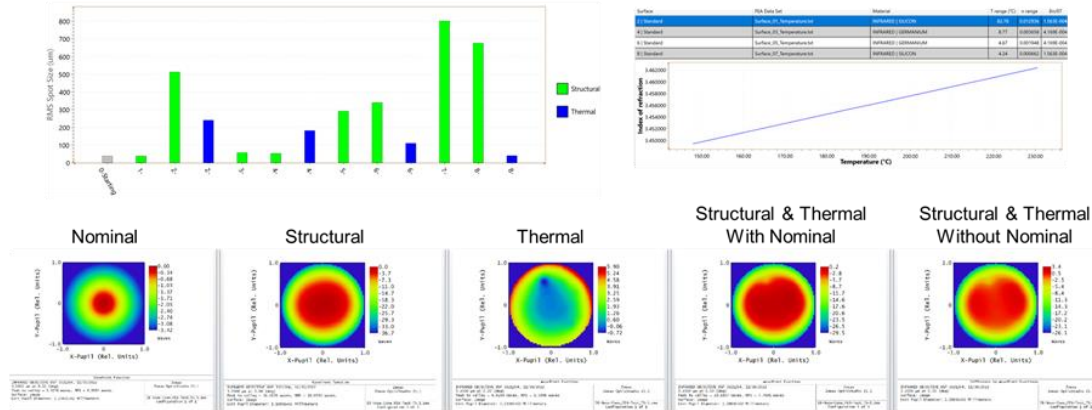

Model Readiness Level Progression

(All Depicted Data is Notional)

Test Data Informed Reduced Order Models as Dig Twins

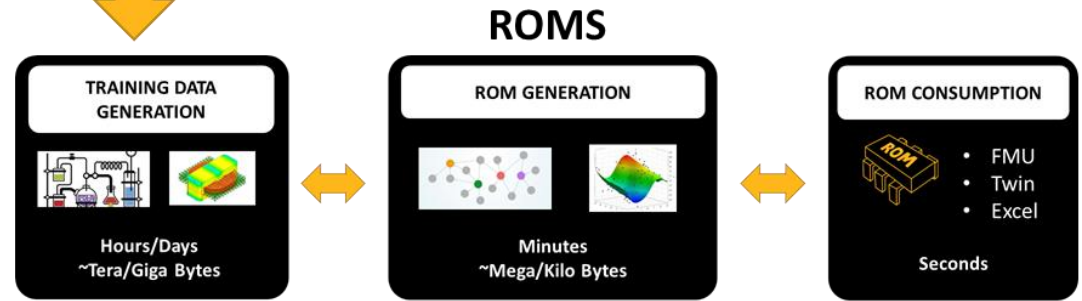

• STAR Specific Analysis Tools

• Overall deformation

• Window deformation

Ansys Advantage:

- ROMs built using a combination of statistical and physics-based machine learning techniques
- ROMs based on small datasets for engineering simulations

(All Depicted Data is Notional)

Digital Mission Engineering Vision

(All Depicted Data is Notional)

Multidomain, physics-based environment

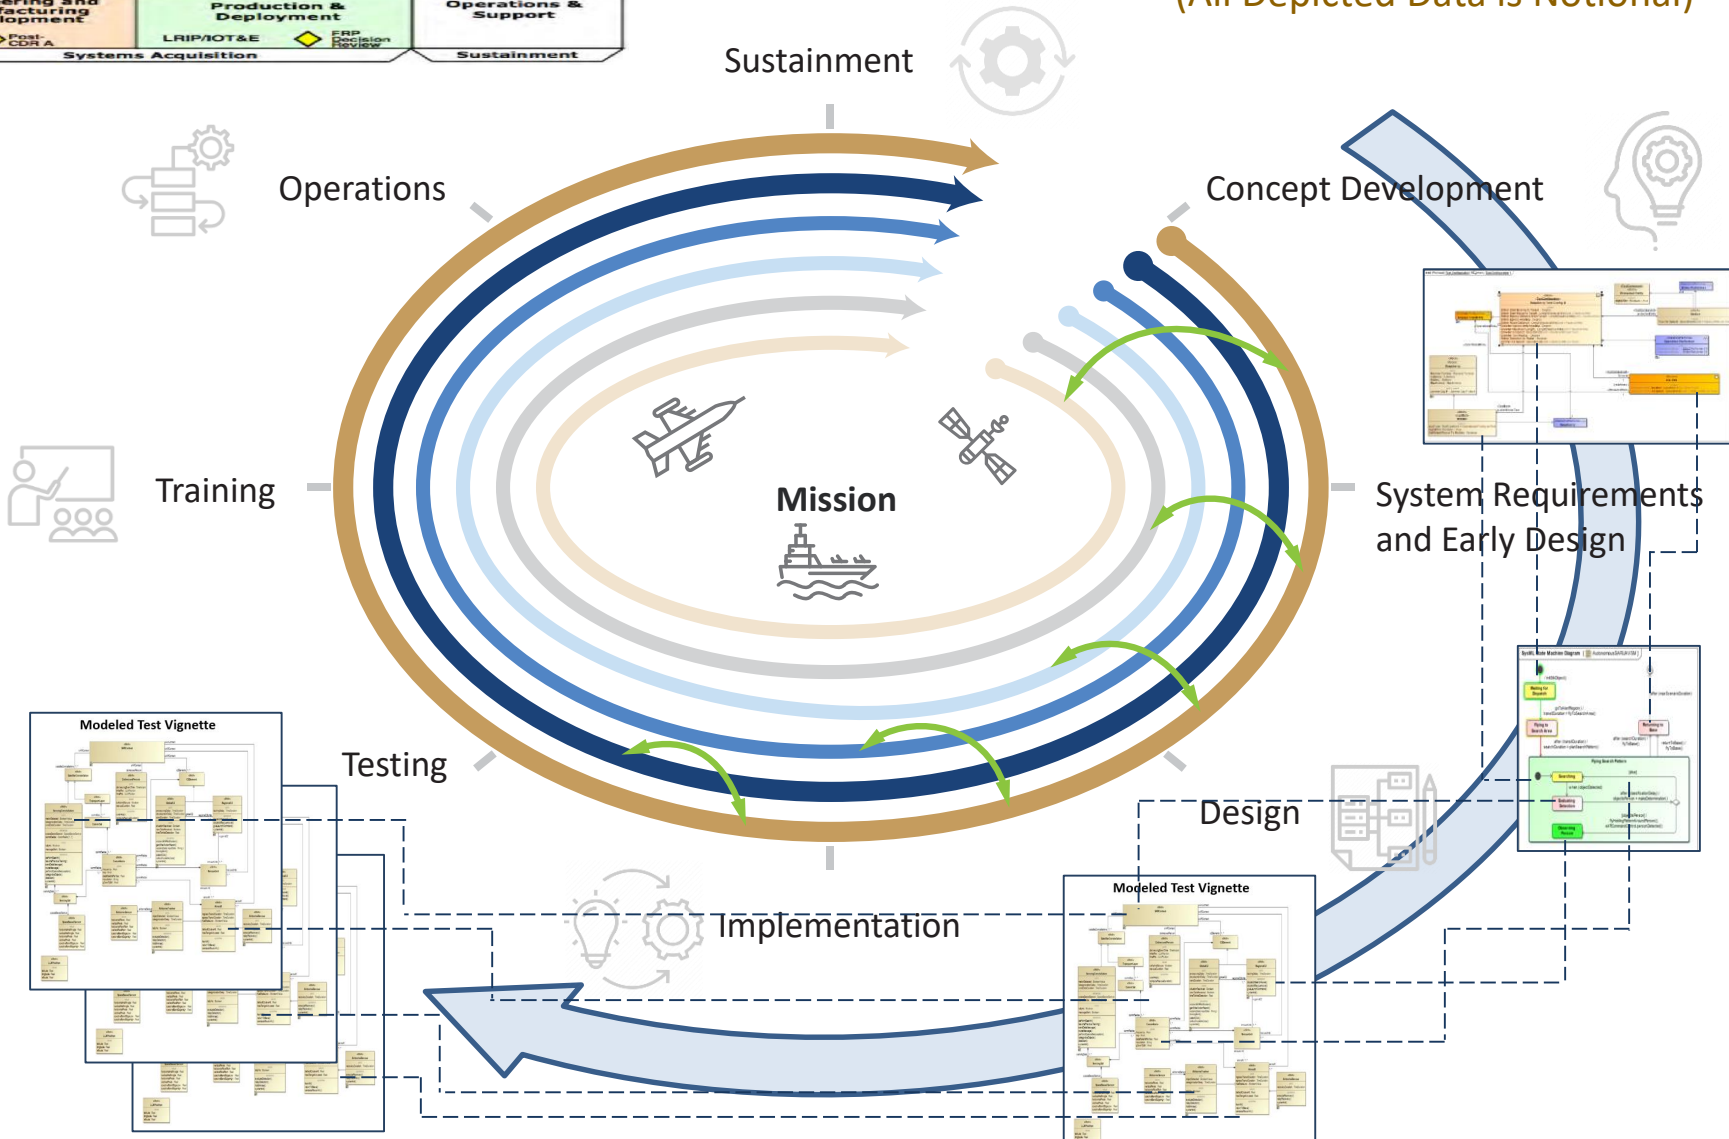

Mission model

System of systems model

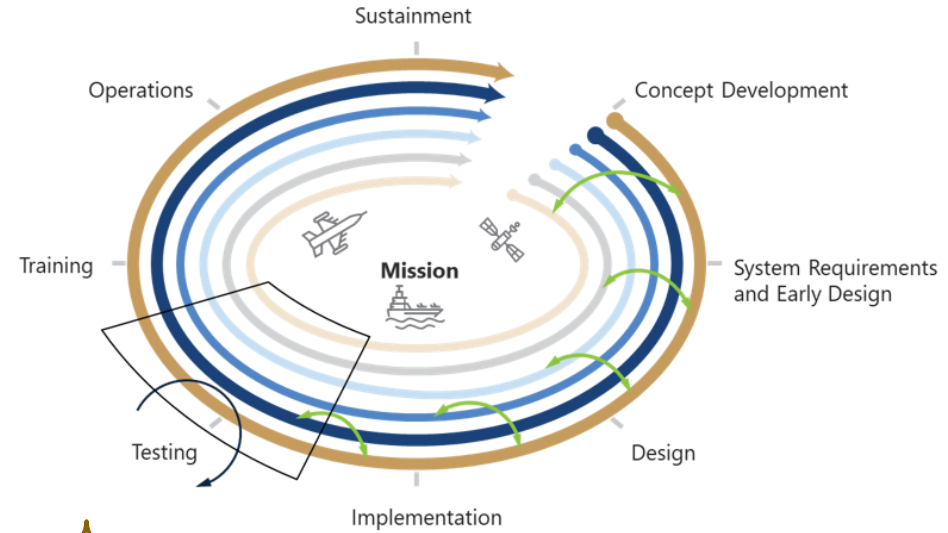

Systems model

Platform model

Component model

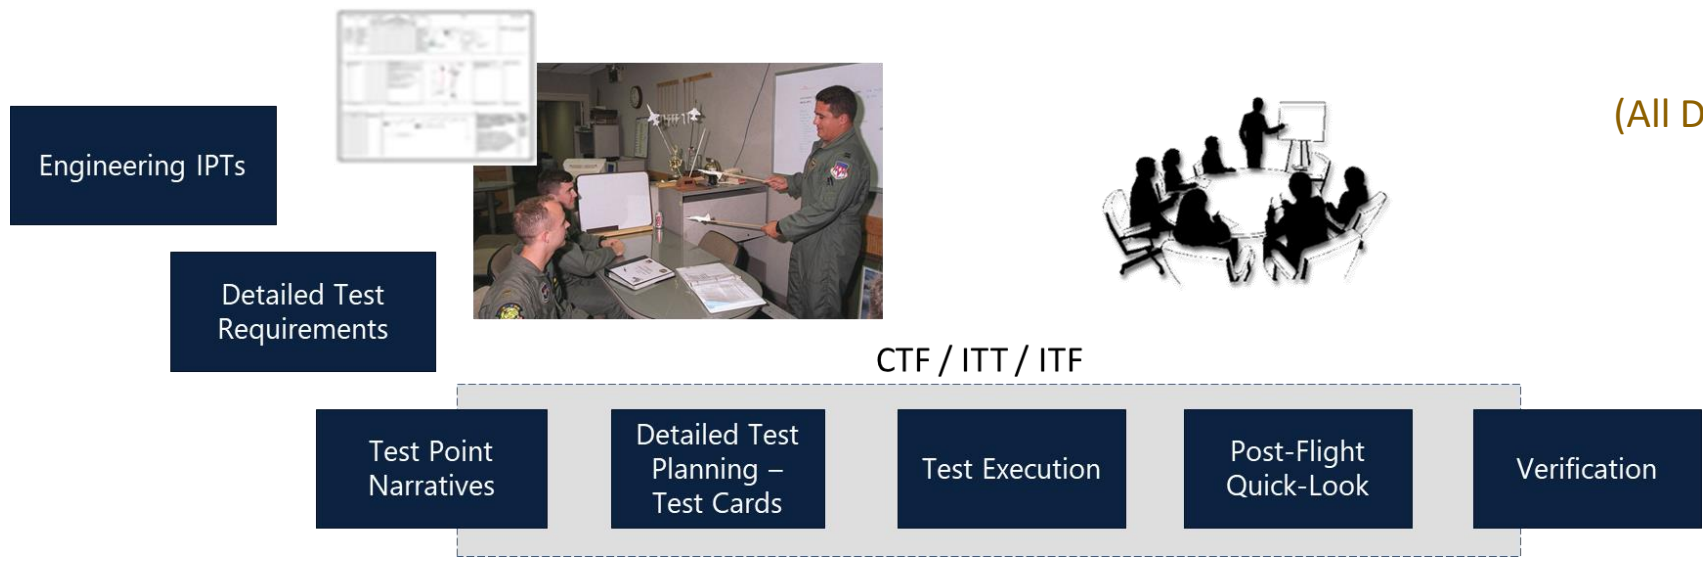

Execution Phase T&E Improvement Opportunity

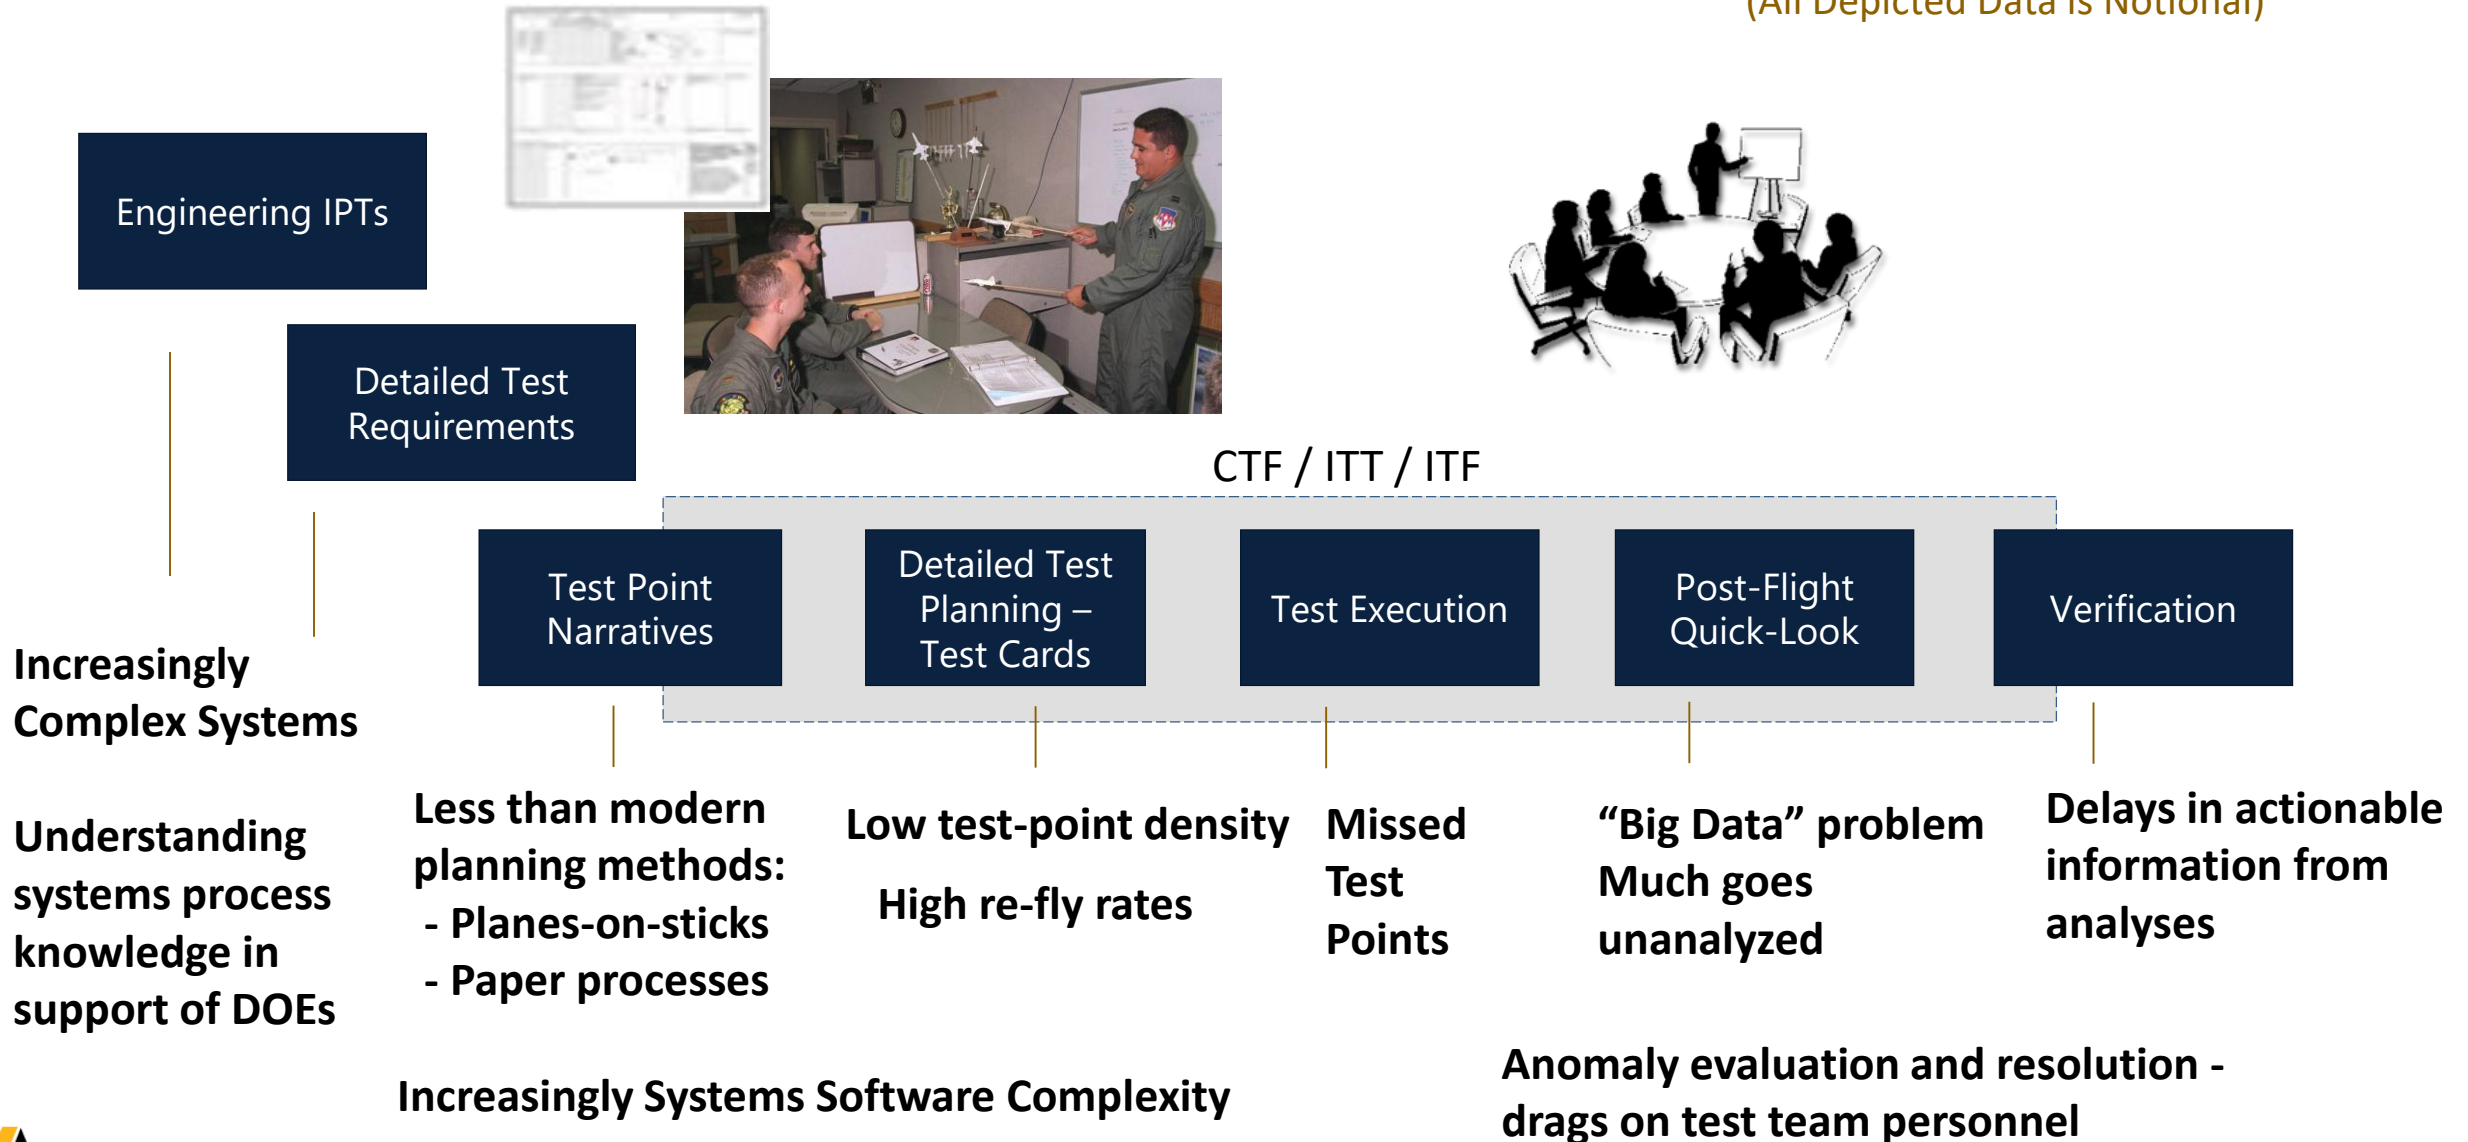

(All Depicted Data is Notional)

(All Depicted Data is Notional)

T&E Execution Phase Process – Challenges

(All Depicted Data is Notional)

“Ad-Hoc / Composable” Modeling - Definition

- Using COTS toolsets including function libraries and higher level physics-based engineering toolsets to achieve “Ad Hoc Modeling” in advancement of “Decision Support”
- Models are “Composed” from standard COTS tools on-demand and to meet a variety of evolving needs across multiple disciplines and use cases
- Models are assembled using those COTS capabilities together with various specifically developed models in support of the Digital Thread by using standard open plug-in interfaces within these toolsets.
- Models are evolved and quantified and validated with test data

Progression of “Composable” Modeling

Complex

Simple

Multi-domain, Multi-vehicle modeling

Multi-vehicle modeling

Detailed Subsystem modeling (physics-based modeling:
comm/radar/EQIR links, ..)

Simplified Subsystem modeling (FOVs, geometric constraints, ..)

Detailed Vehicle Performance modeling

Simplified Vehicle Performance modeling

Dynamic Geometry and FOVs modeling

(All Depicted Data is Notional)

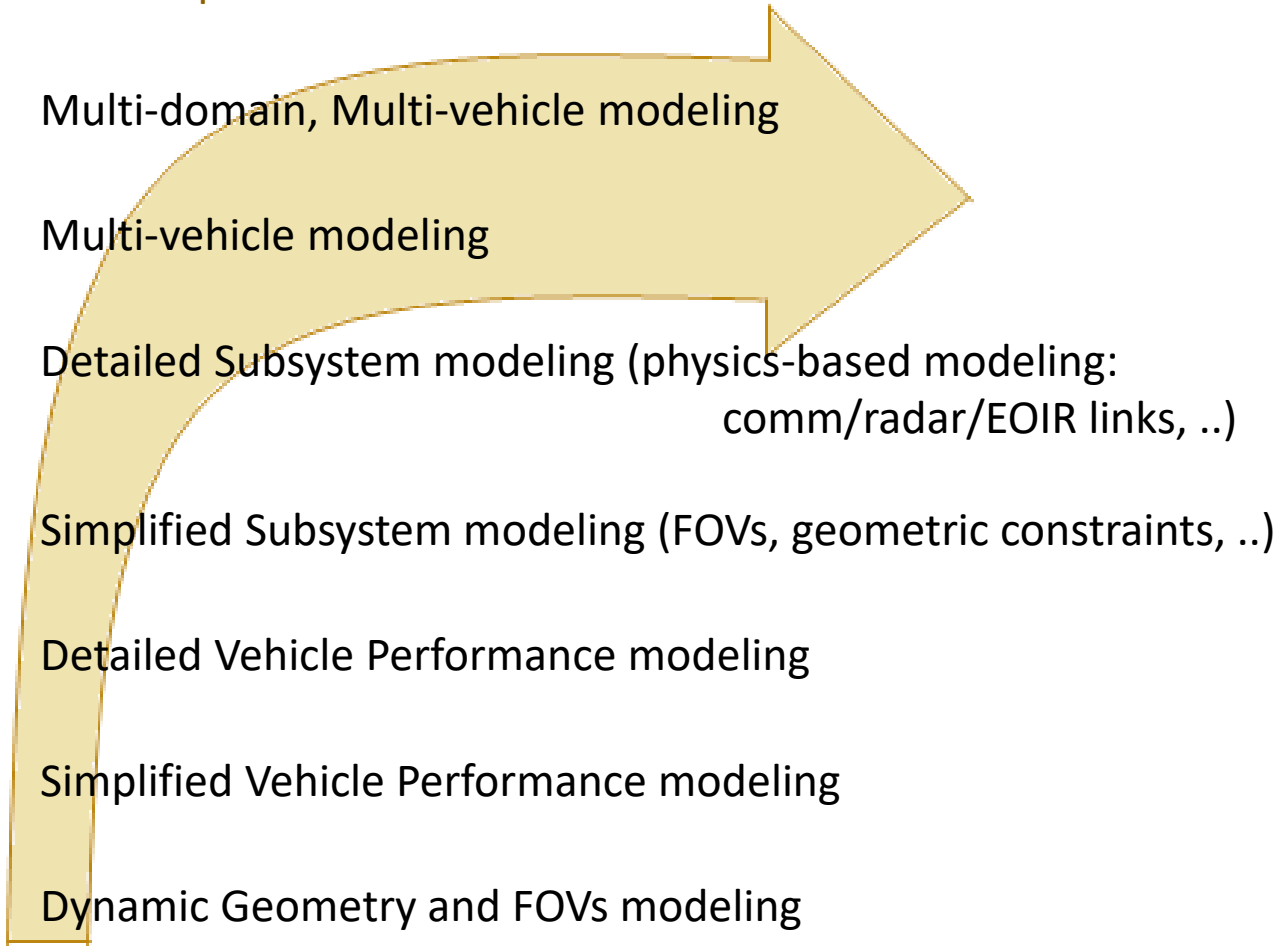

Progression of “Composable” Modeling

Fast / Composable

Long-lead Time / Significant Development Buildout

(All Depicted Data is Notional)

Complex
Simple

Test Ops Composable Modeling

- Efficiency of Test Team
- Efficiency & Effectiveness of Test Activity
- Communication among stakeholders
- Flight Safety

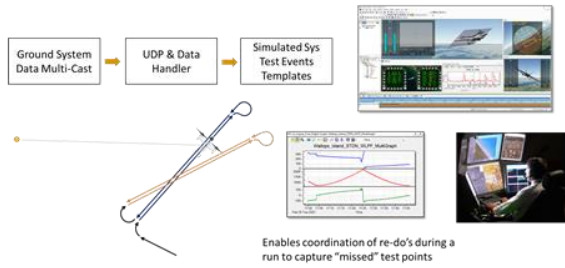

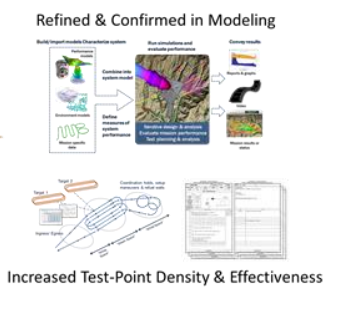

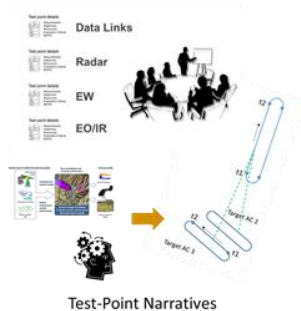

Test Point Narratives

Detailed Test Planning – Test Cards

Test Execution

Post-Flight Quick-Look

Verification

★
Increased Test-Point Density

★
Improved Re-Fly Rate

★
Saved Test-Points

★
Faster and More Informative Quick-Looks

★
Quicker Feedback Loop with Planning, Engineering & Software Dev

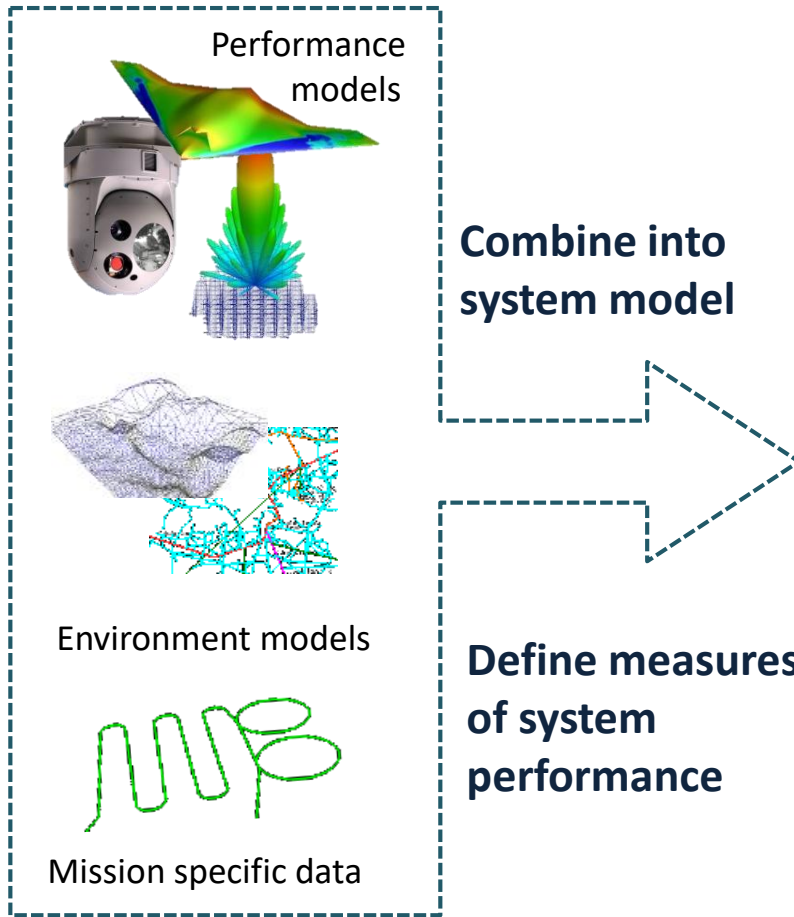

★ **Test personnel efficiency**

★ **Flight Safety**

(All Depicted Data is Notional)

Composable Model Based T&E in Mission Context **NDIA**

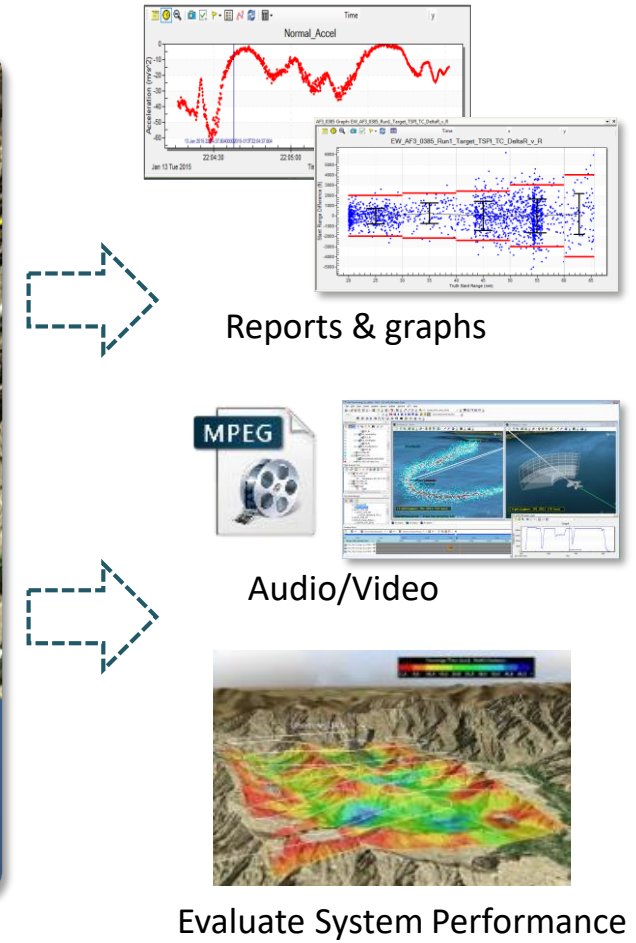

Build/import models characterize system

Run simulations and evaluate performance

Assess & convey results

Refine models based on test data results

(All Depicted Data is Notional)

Example Composable Modeling: Dynamic Link Analysis

(All Depicted Data is Notional)

Transmit power & frequency
 Transmit angles
 Transmit antenna gains
 EIRP
 Propagation Losses

Transmitter

Rain
 Absorption
 Diffraction (terrain)
 Diffraction (urban prop)

Channel

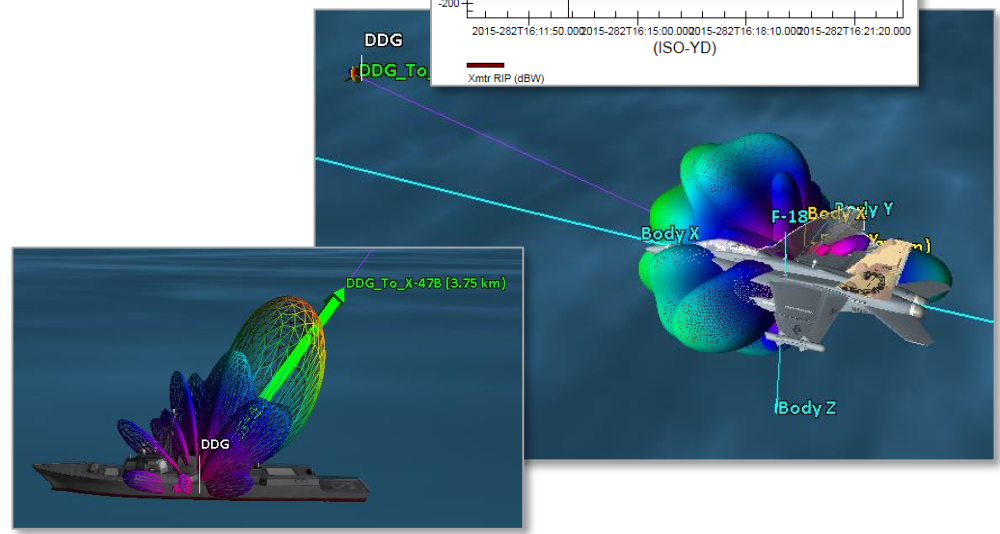

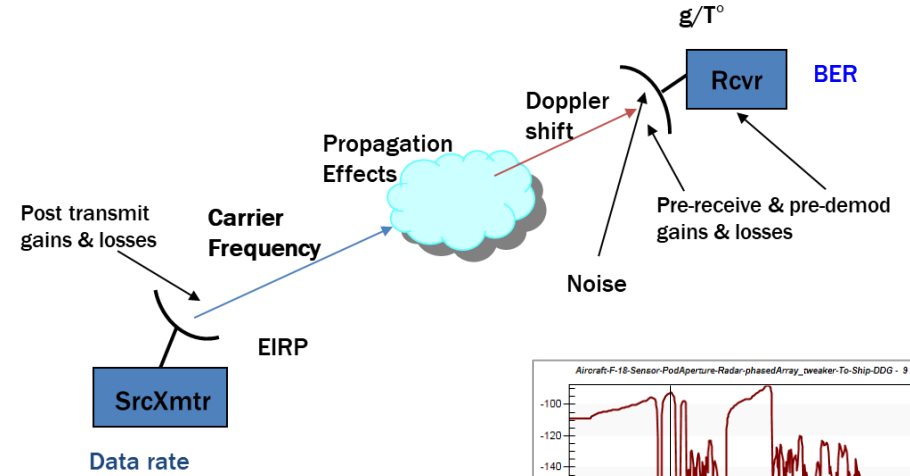

Frequency Doppler effects
 Receive angles
 Receive frequency
 Receive antenna gains
 Received Isotropic Power
 Noise temperatures

Receiver

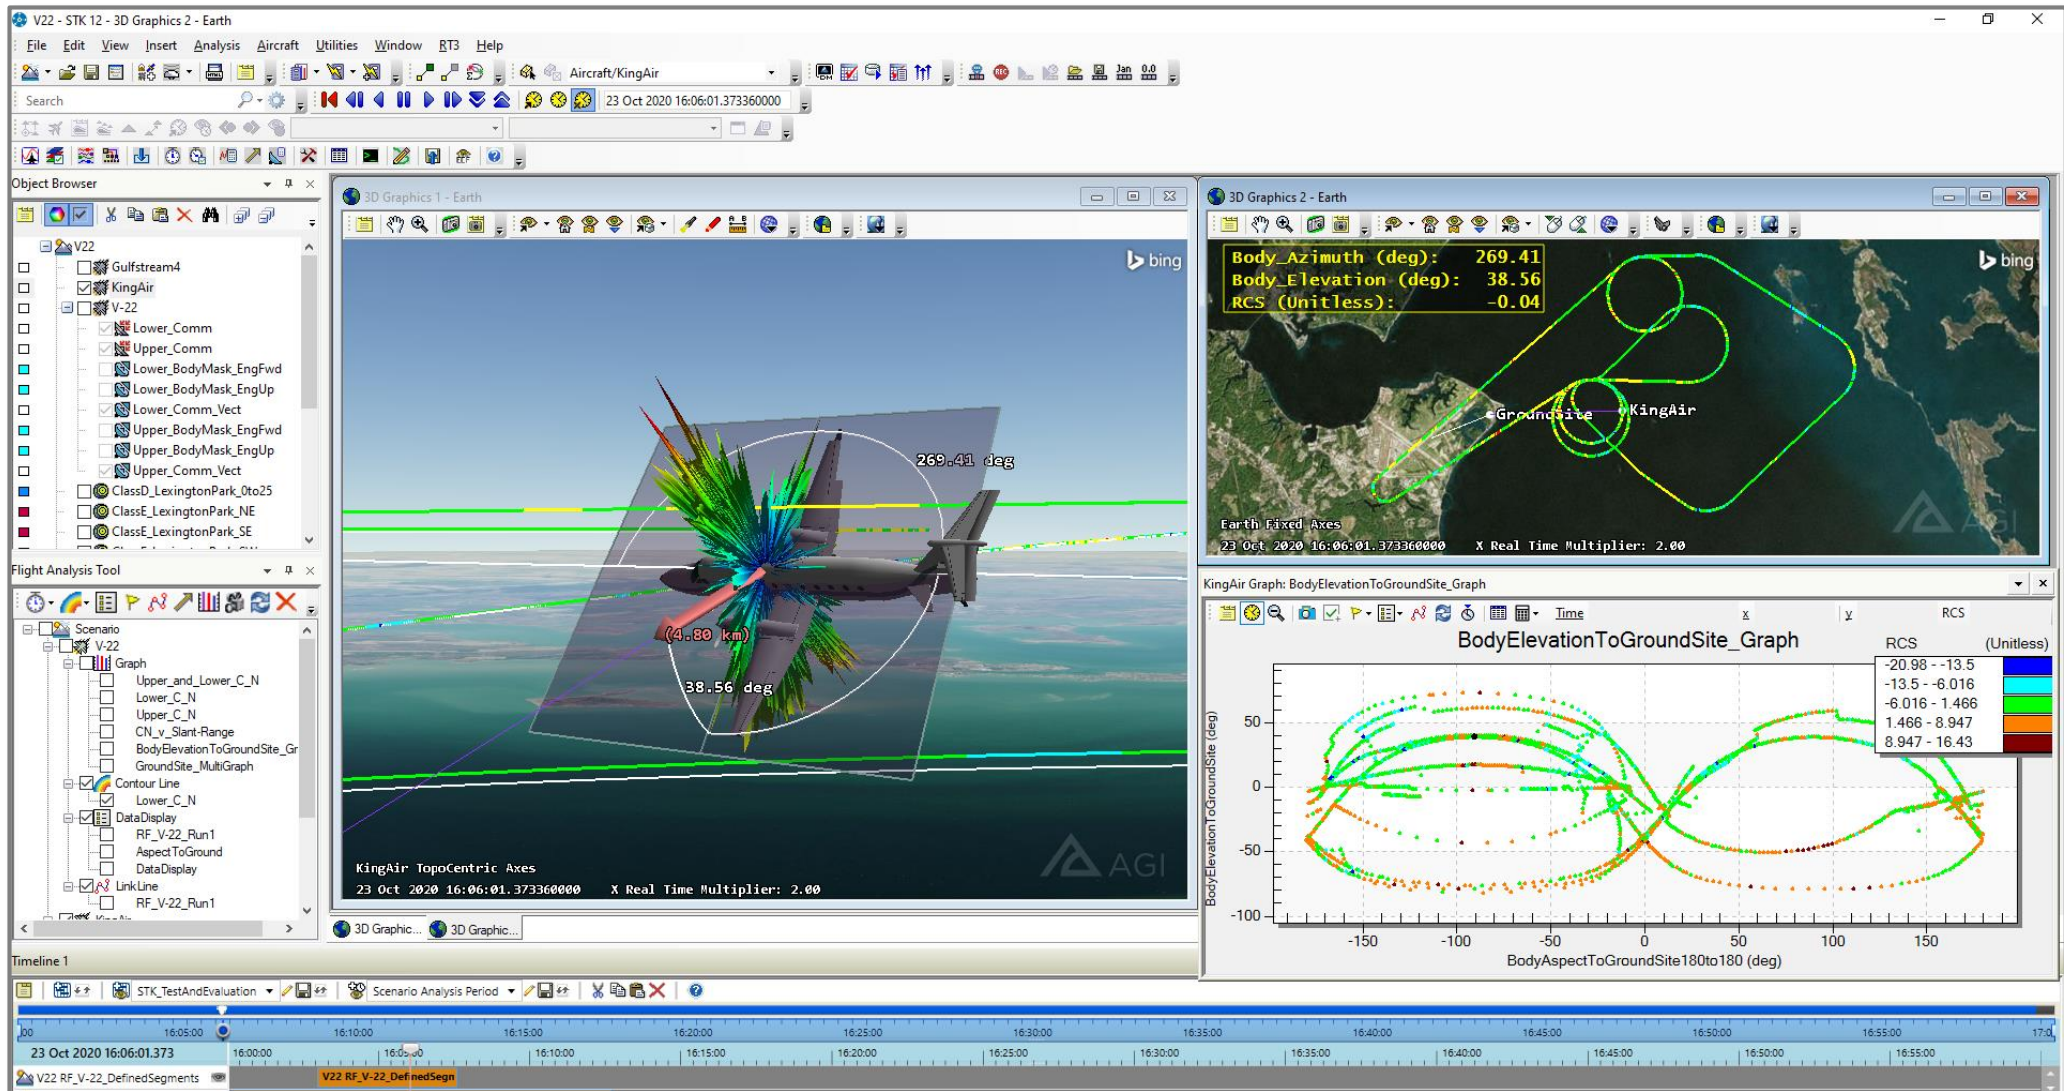

Sun
 Earth impingement

C/N, C/No, C/(N+I)
 Eb/No, Eb/(No+Io)
 BER ...

System Performance

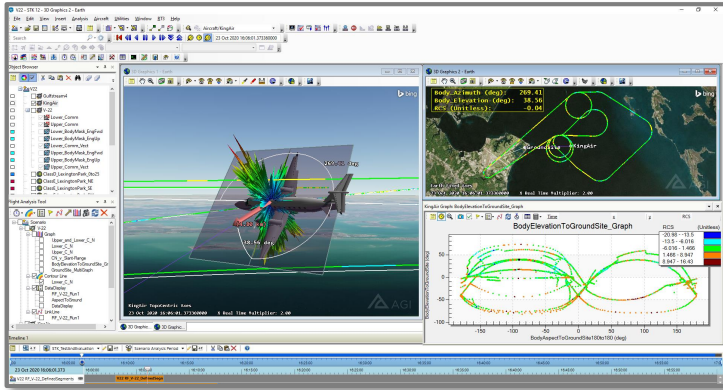

Example - Radar RCS Analysis In T&E Mission Space

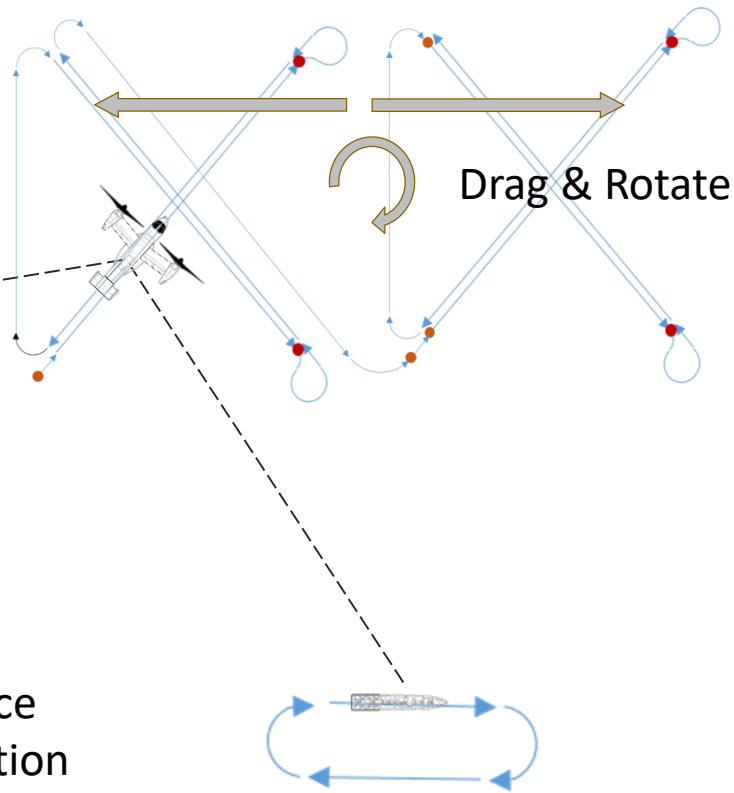

(All Depicted Data is Notional)

Interactive Test-Point Narratives Design

(All Depicted Data is Notional)

Assess Relevant Metrics

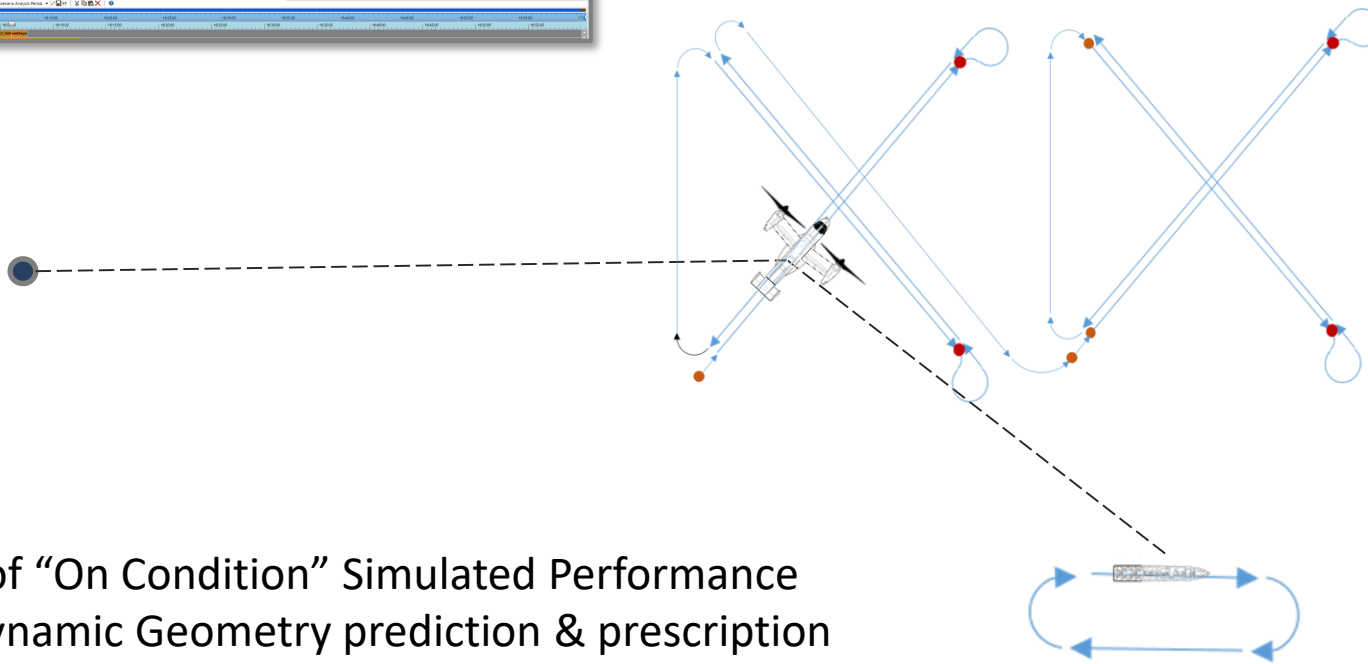

Test of “On Condition” Simulated Performance

- Dynamic Geometry prediction & prescription
- System Performance prediction & prescription

Interactive Test-Point Narratives Design

(All Depicted Data is Notional)

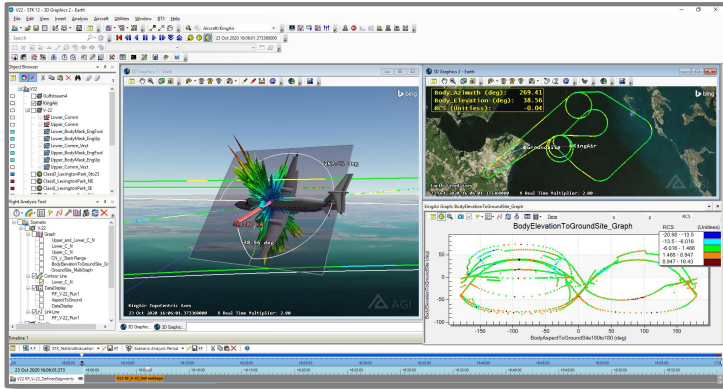

Assess Relevant Metrics

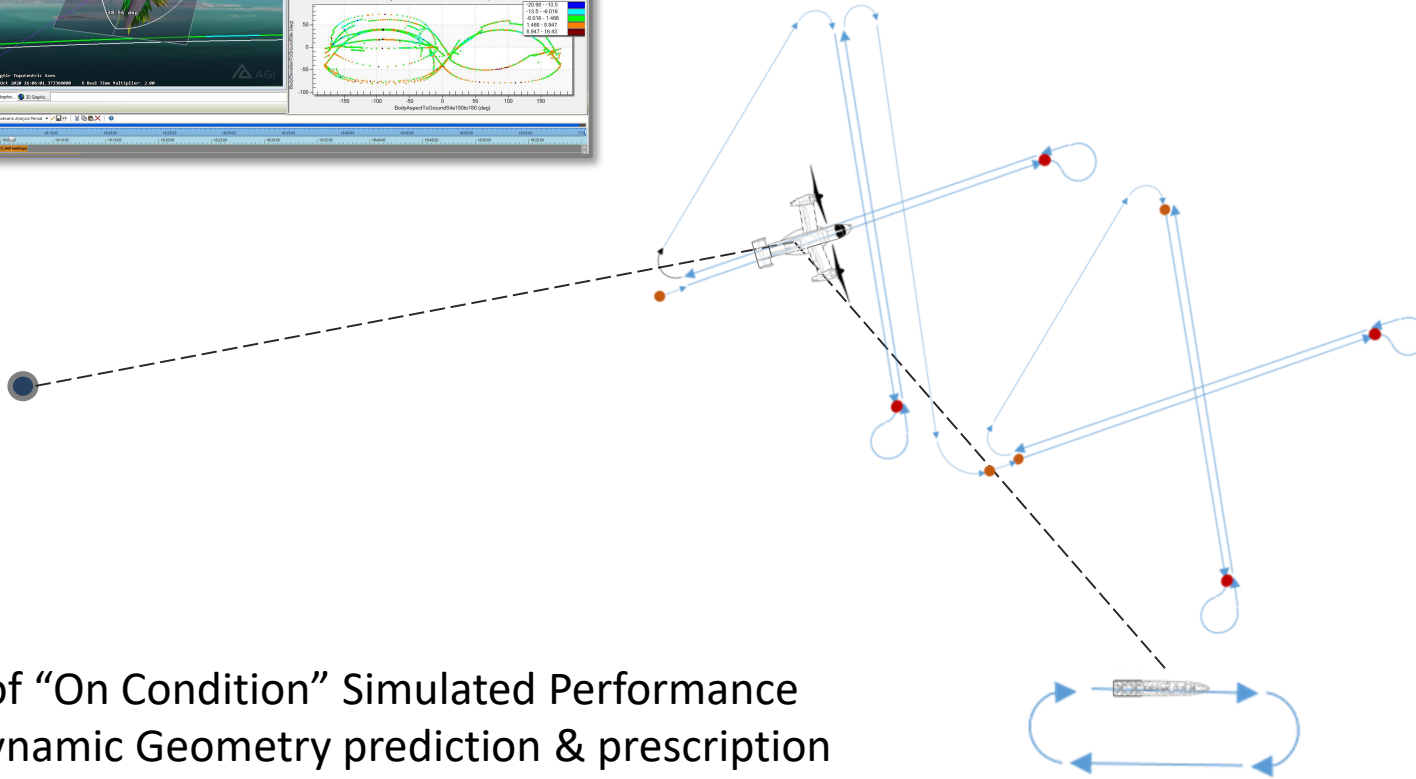

- Test of “On Condition” Simulated Performance
- Dynamic Geometry prediction & prescription
 - System Performance prediction & prescription

Interactive Test-Point Narratives Design

(All Depicted Data is Notional)

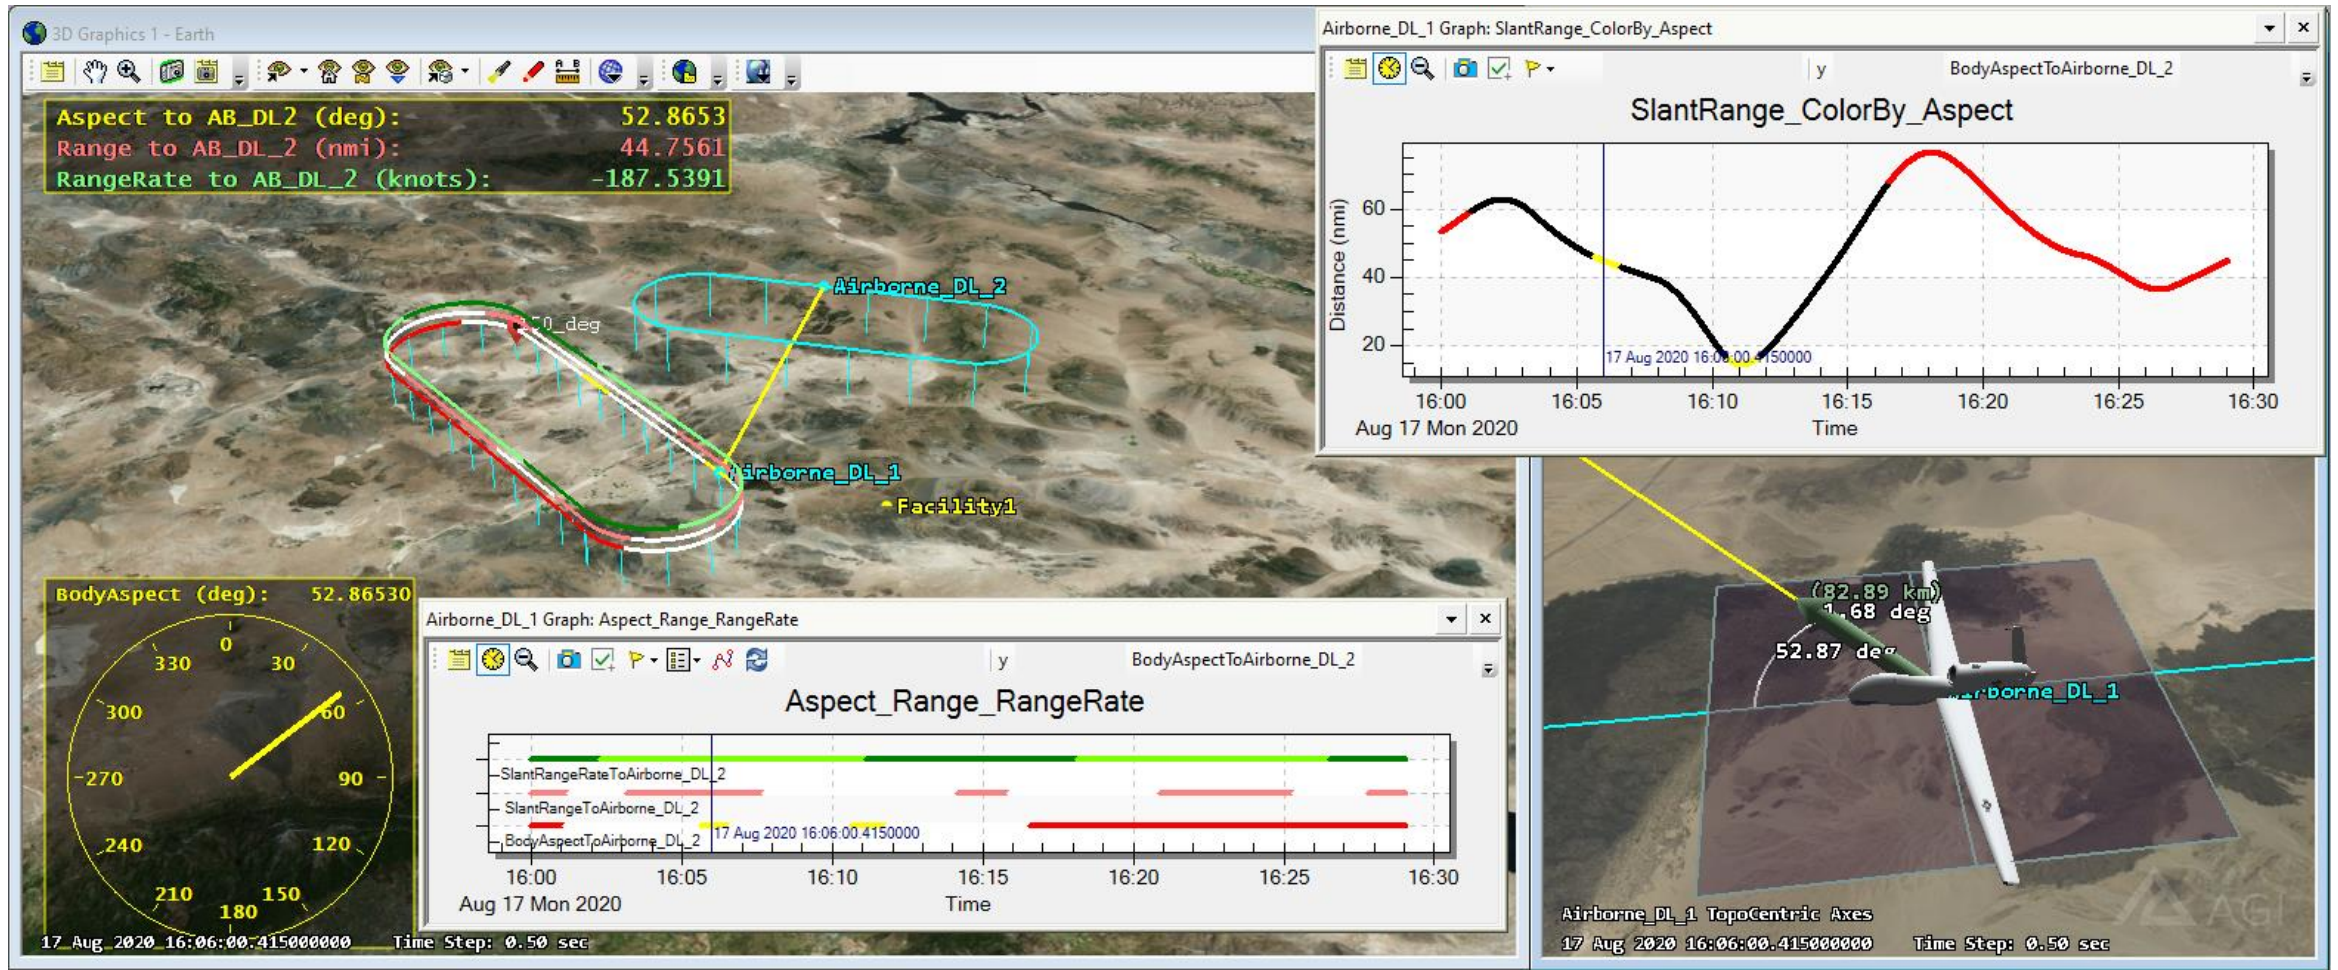

Assess Relevant Metrics

Test of “On Condition” Simulated Performance

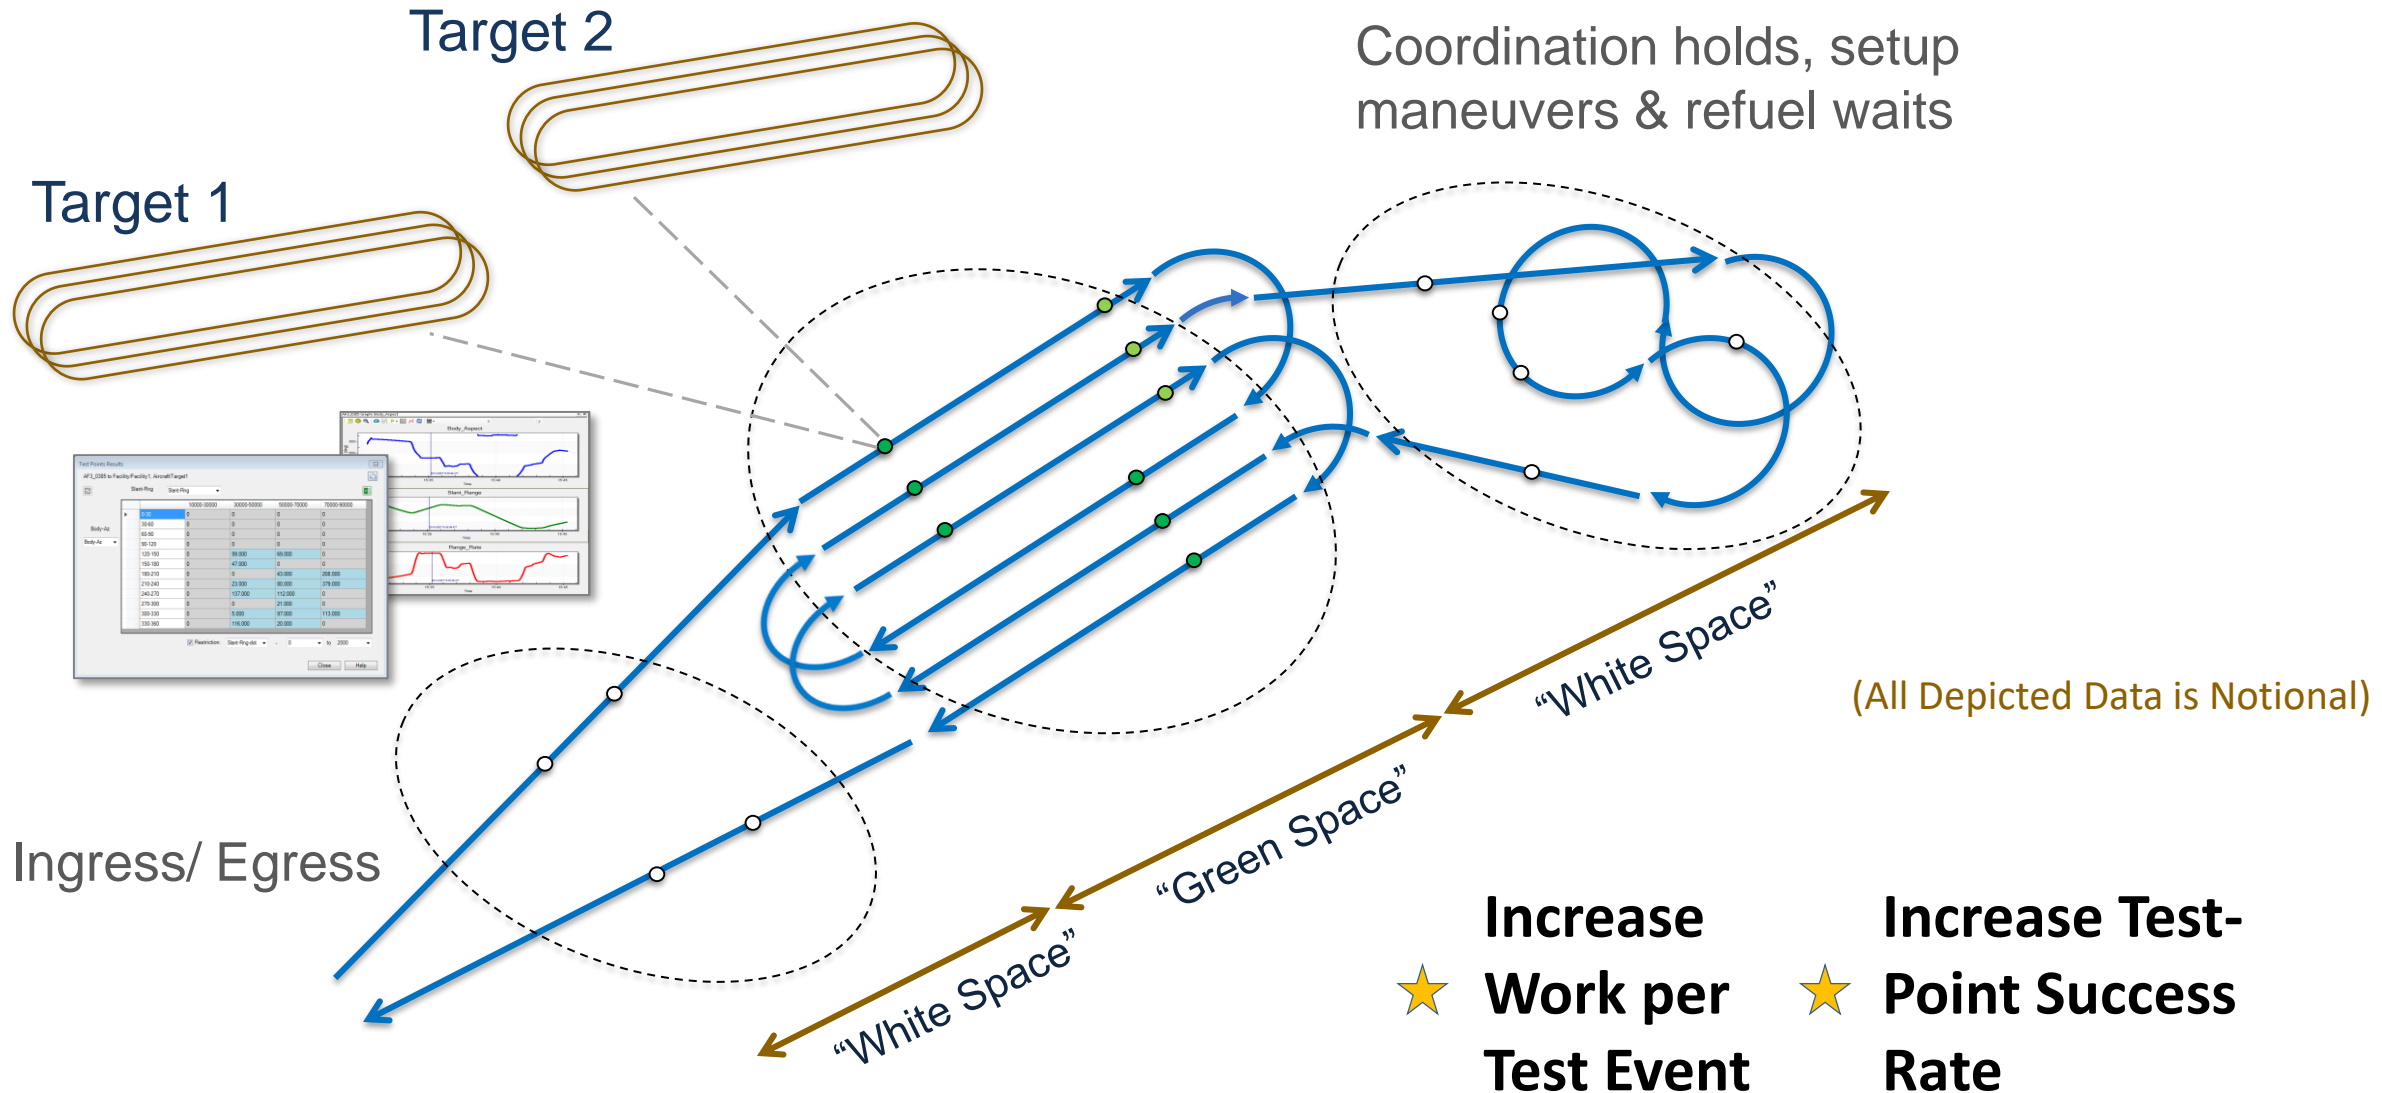

- Dynamic Geometry prediction & prescription
- System Performance prediction & prescription

Decision Support to Detailed Test Planning

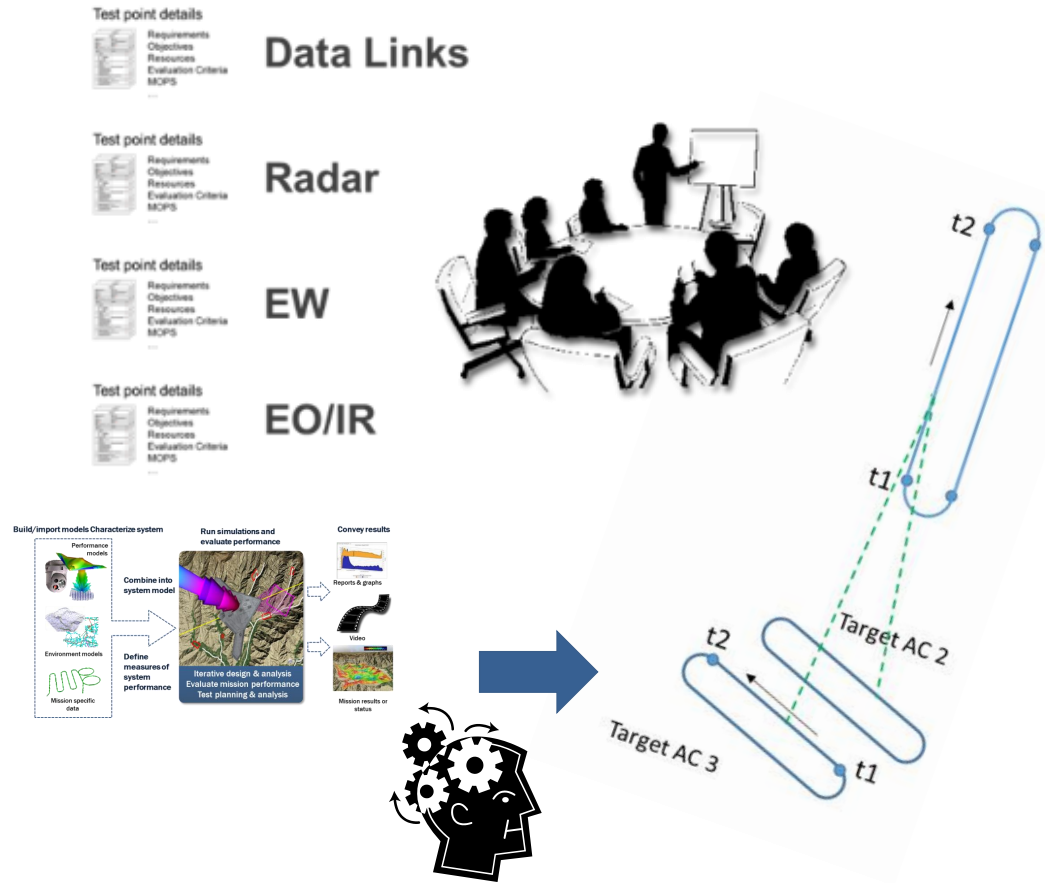

(All Depicted Data is Notional)

Improved Efficiency & Effectiveness of Test Events

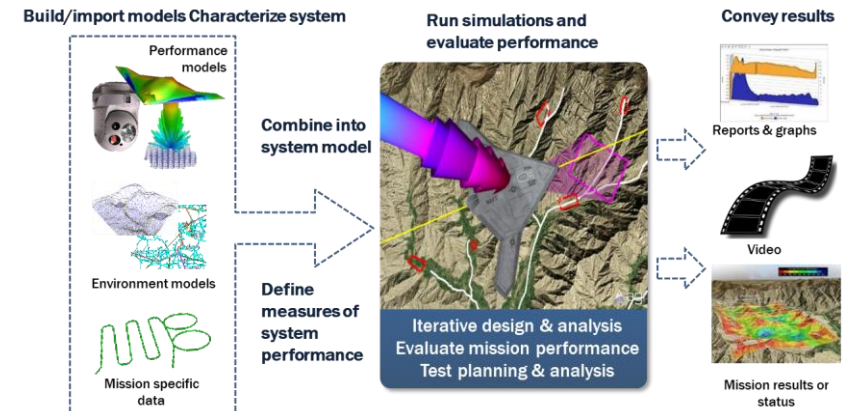

Impact on Planning Efficiency & Effectiveness

Test-Point Narratives

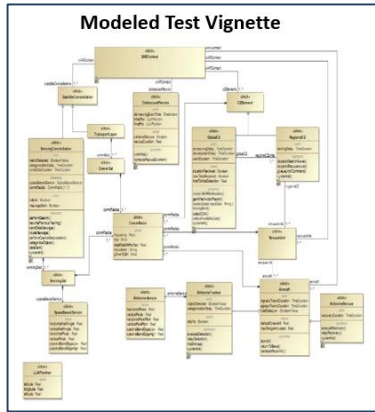

Refined & Confirmed in Modeling

Increased Test-Point Density & Effectiveness

(All Depicted Data is Notional)

MBT&E Composed Detailed Test Planning Templates

Location Specific Range Data

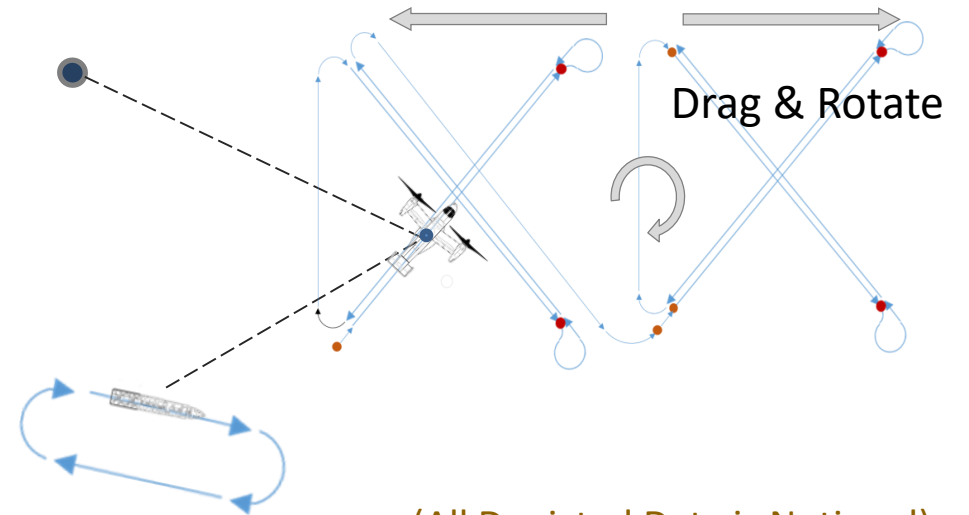

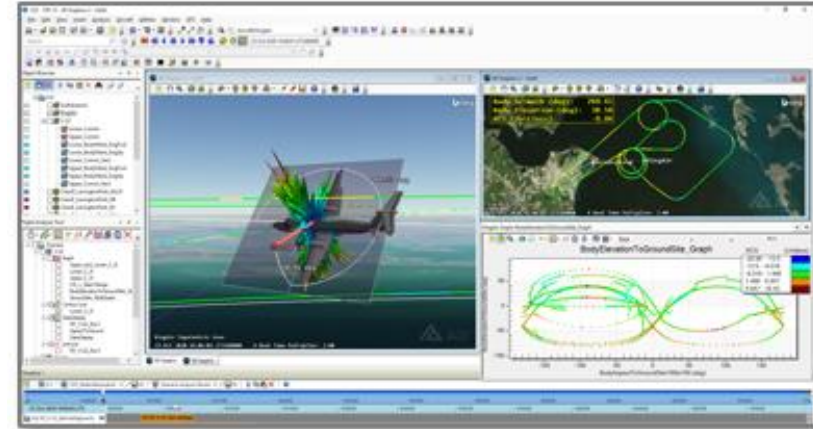

C2, Telemetry, Terrain, Airspaces, ...

Aircraft Performance Model

3DOF model, 6DOF model, Engine Performance

Mission Systems Model

Radar System Constraints, Operating Parameters, ...

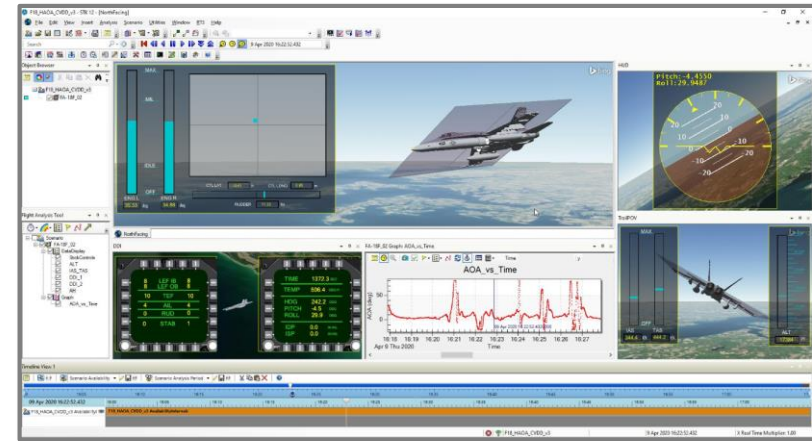

(All Depicted Data is Notional)

Real-Time Decision Support

Real-time decision support

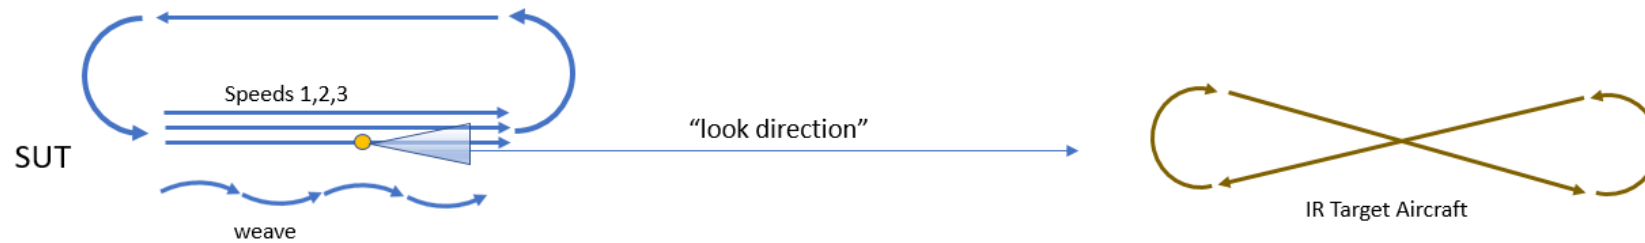

★ “Post-flight” anytime during test event

★ Enables coordination of re-do’s during a run to capture “missed” test points

(All Depicted Data is Notional)

Notional Test Event Narrative Development

Notional IR Pod Test Vignette Narrative

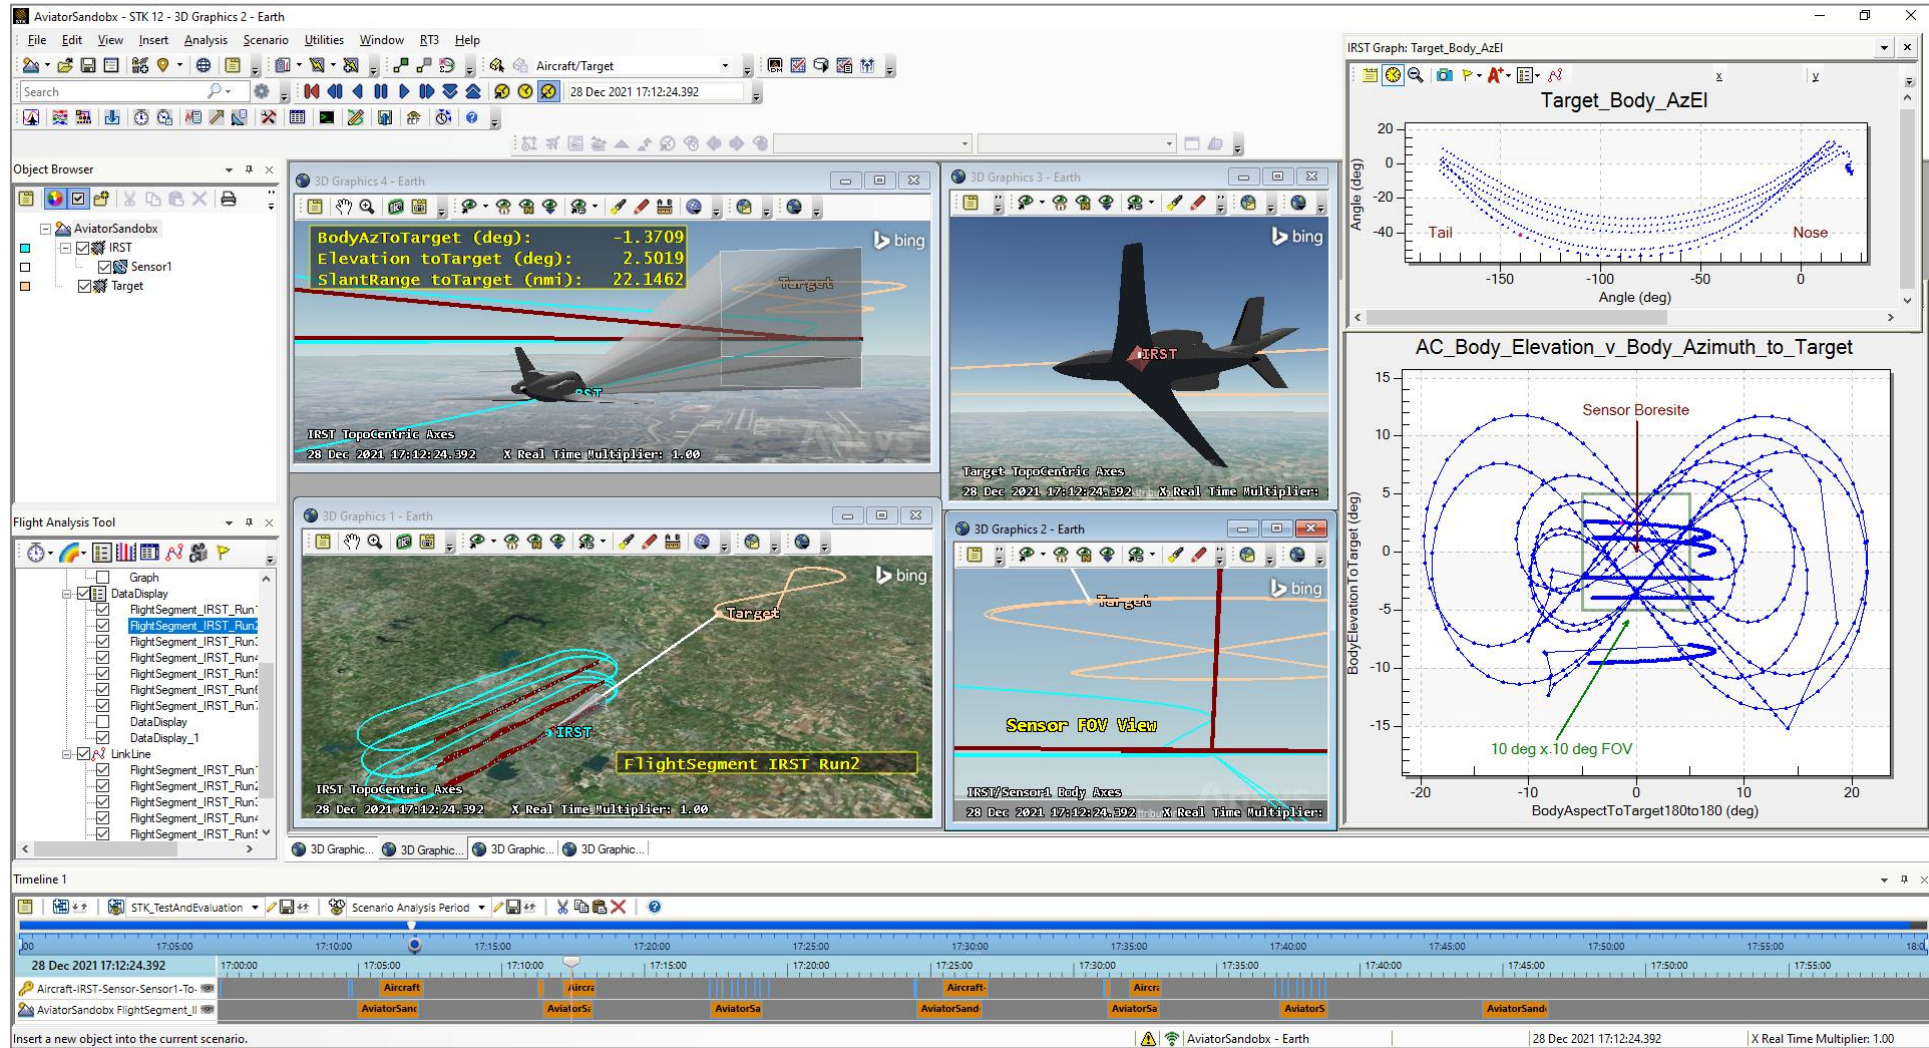

Repeat racetrack three times at each altitude with each cycle at a different speed in the direction to target.
Repeat one rev with a weave pattern

Cross wind added to affect side-slip

(All Depicted Data is Notional)

Example: Test Requirements Evaluation

(All Depicted Data is Notional)

Post-Test Analysis & Verification

(All Depicted Data is Notional)

- Open Air Flight Tests
- T&E Labs Results
- Simulations

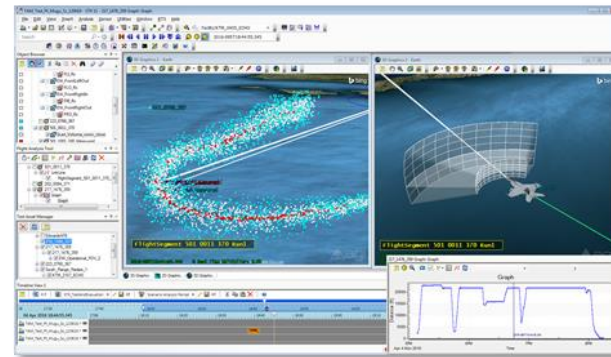

Typical Project Test Data Database with Metrics names index

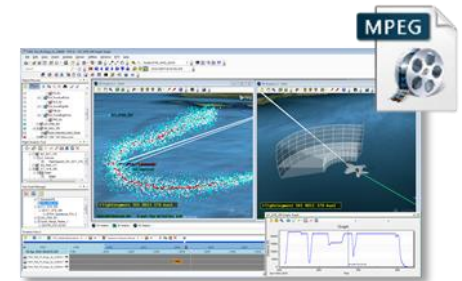

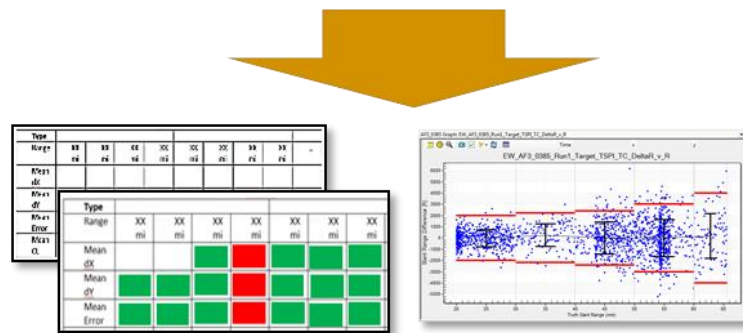

- Vehicles
 - .e, .a, covariance
- Vectors
- Scalars
- Sensor Volumes
- Tracks (pos, cov)
- ATC MTOs

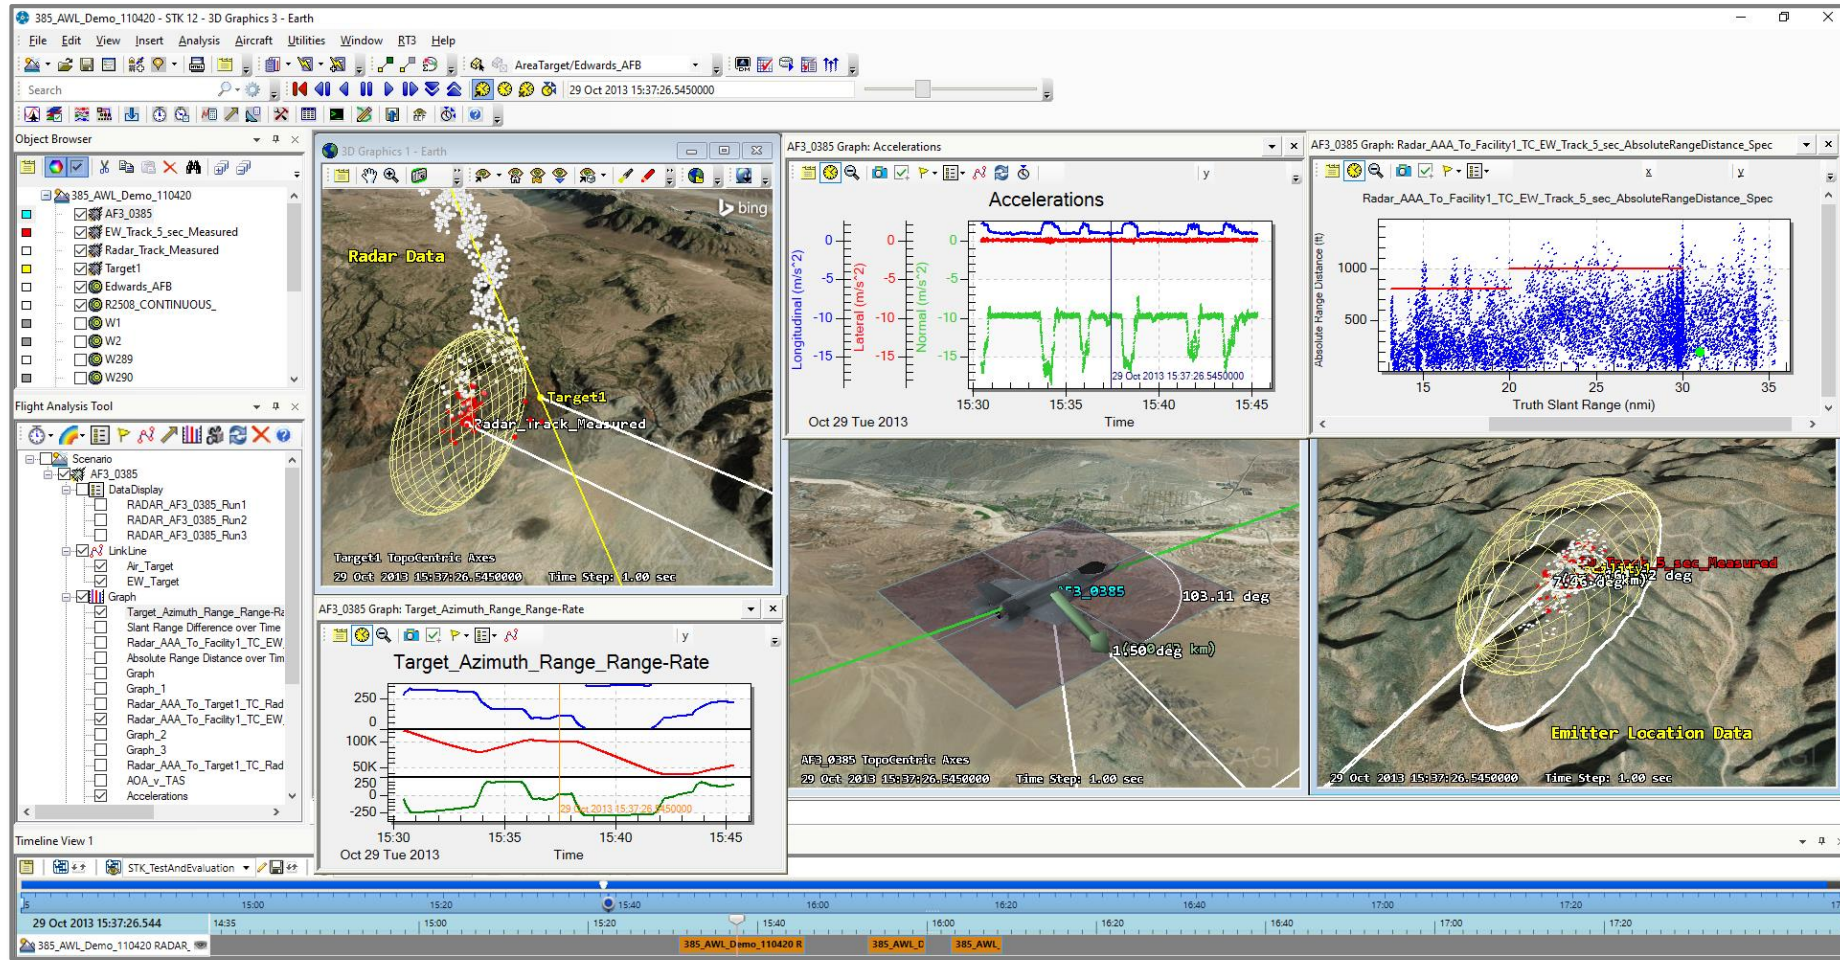

Modeled Elements

- Quick-look
- Flight reconstruction
- Track analysis
- Verification products
- Visualizations & Animations

More Inciteful Post-Flight Quick Looks

★ “Richer” post-flight quick looks

★ Immediate post-flight decision support

★ Means to communicate key issues among various discipline stakeholders

(All Depicted Data is Notional)

Benefits of Composable Modeling

- Efficiency of Test Team
- Efficiency & Effectiveness of Test Activity
- Communication among stakeholders
- Flight Safety

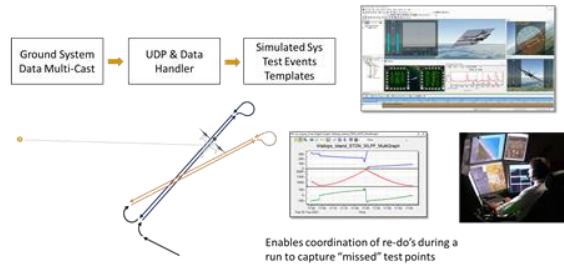

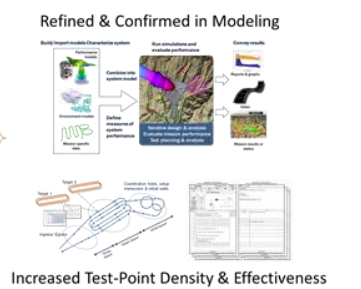

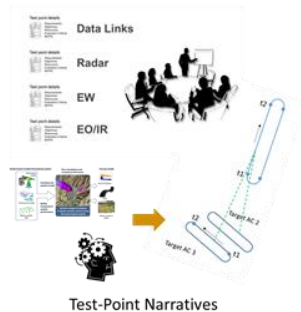

Test Point Narratives

Detailed Test Planning – Test Cards

Test Execution

Post-Flight Quick-Look

Verification

★
Increased Test-Point Density

★
Improved Re-Fly Rate

★
Saved Test-Points

★
Faster and More Informative Quick-Looks

★
Quicker Feedback Loop with Planning, Engineering & Software Dev

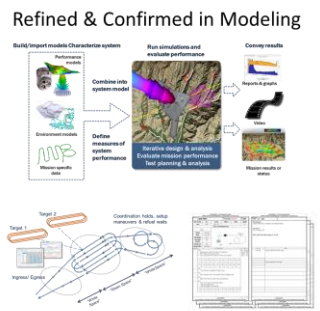

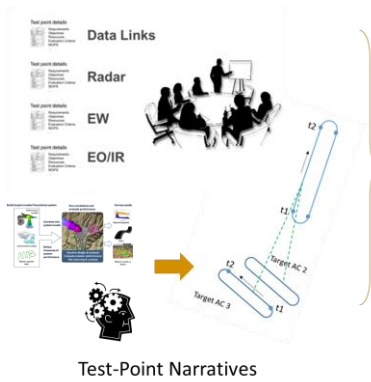

★
Test personnel efficiency

★
Flight Safety

(All Depicted Data is Notional)

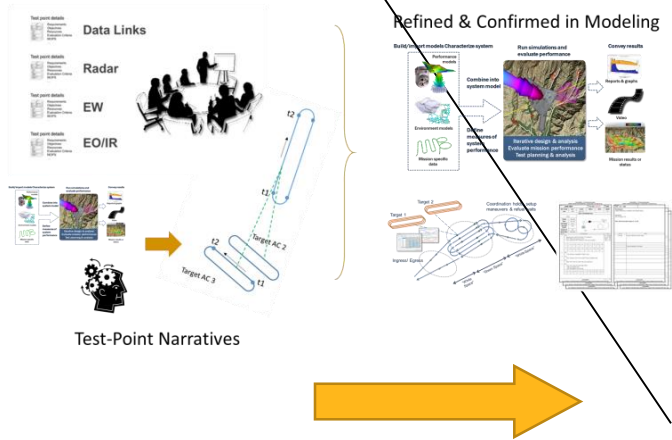

Application Throughout Program Life Cycle

(All Depicted Data is Notional)

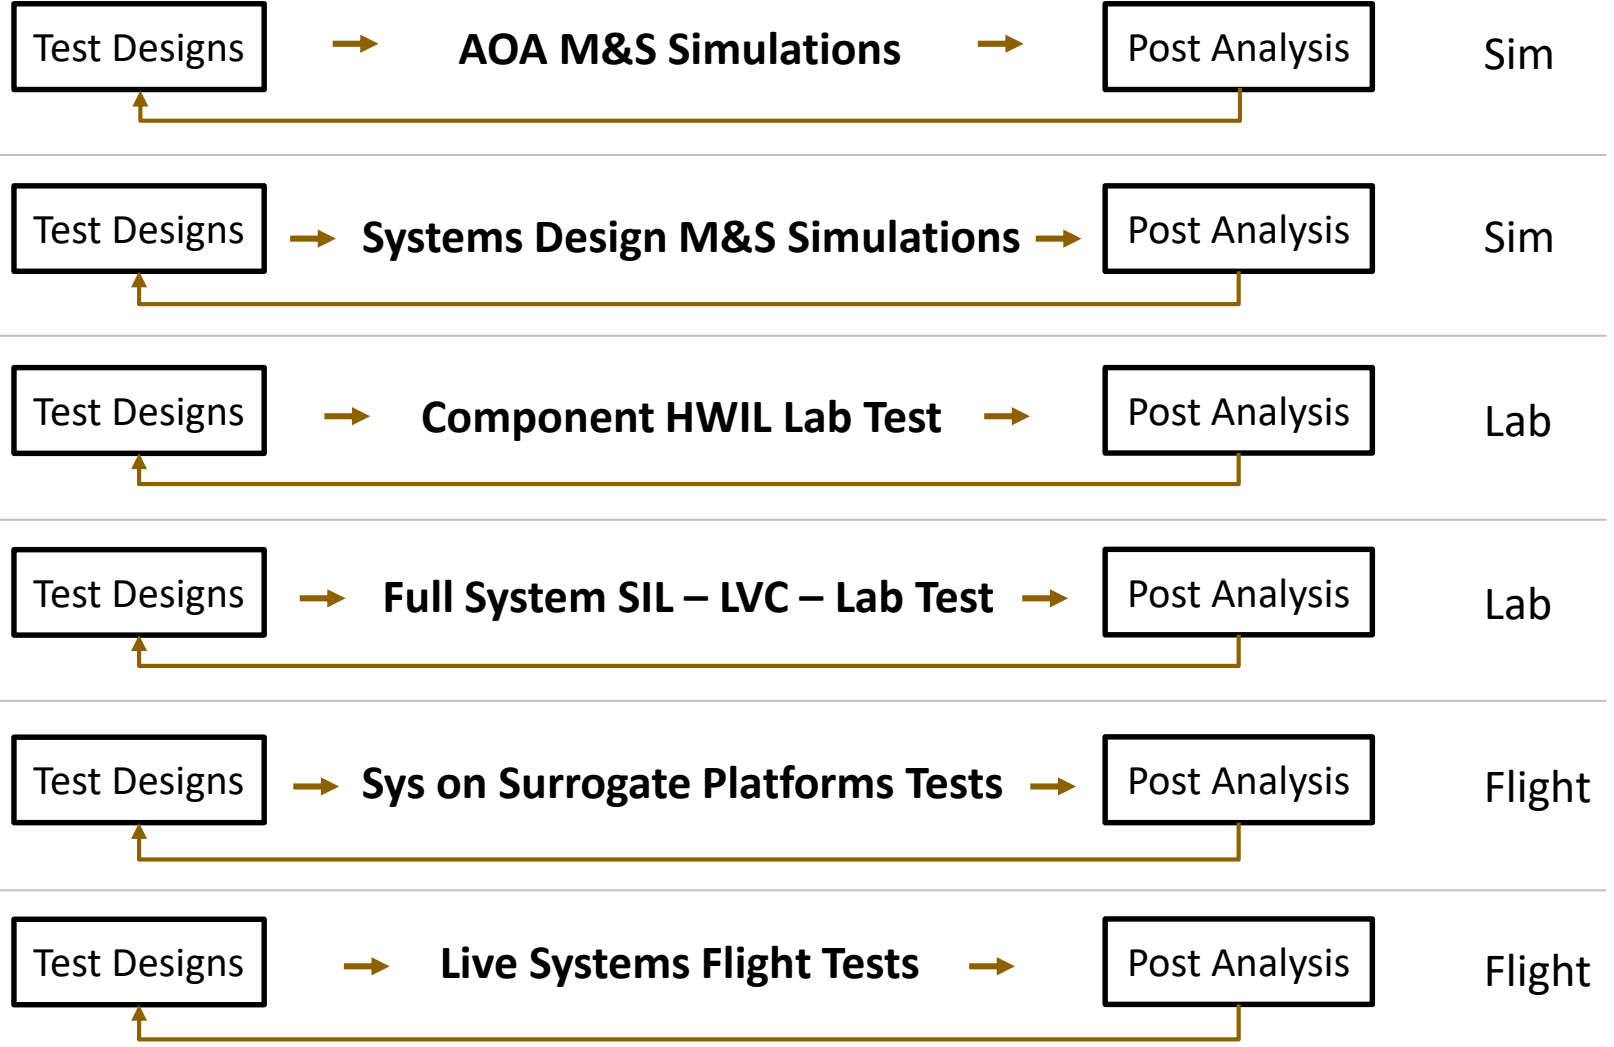

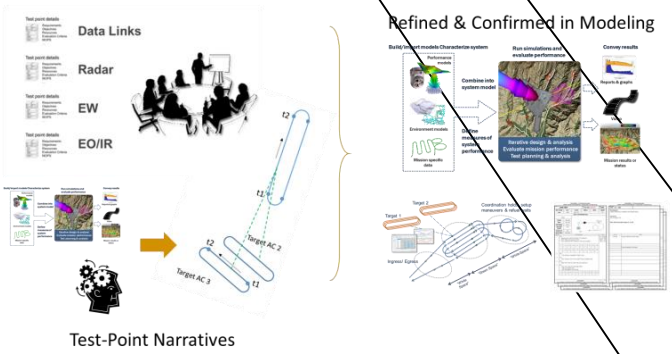

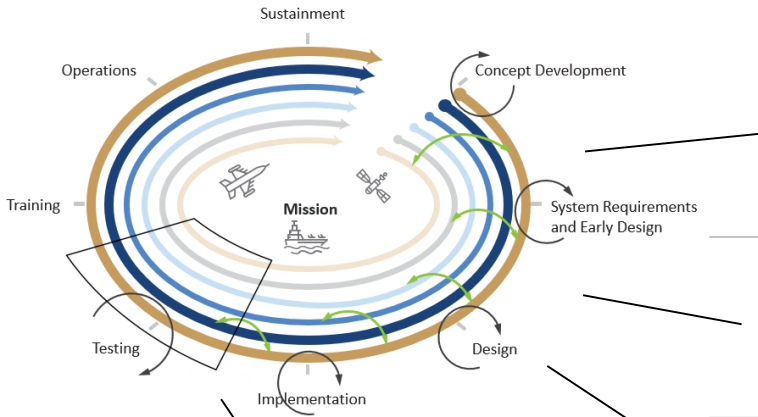

Application Throughout Program Life Cycle

(All Depicted Data is Notional)

Application Throughout Program Life Cycle

(All Depicted Data is Notional)

Concluding Remarks

- Modern COTS composable physics-based engineering tools are available and quickly configurable for ad hoc use to great effect
- Application to “Execution Phase Test” can occur long before full lifecycle application of Digital Engineering in major programs
- Can provide a dramatic effect on efficiency and effectiveness of test execution planning and analysis operations
- Provides for T&E workforce development in advance and in preparation of full DE transformation
